

The **KINGBIRD**

VOL. 45, NO. 3

SEPTEMBER • 1995

FEDERATION OF NEW YORK STATE BIRD CLUBS, INC.

THE KINGBIRD (ISSN 0023-1606), published quarterly (March, June, September, December), is a publication of The Federation of New York State Bird Clubs, Inc., which has been organized to further the study of bird life and to disseminate knowledge thereof, to educate the public in the need for conserving natural resources, and to encourage the establishment and maintenance of sanctuaries and protected areas.

Memberships are on a calendar year basis only, in the following annual categories: Individual \$18, Family \$20, Supporting \$25 Contributing \$50, The Kingbird Club \$100, Student \$10. Life Membership is \$900. Applicants for Individual or Family Membership applying in the second half of the year may reduce payment by one-half.

APPLICATION FOR MEMBERSHIP should be sent to the Chairwoman of the Membership Committee: Myrna Hemmerick, P.O. Box 2203, Setauket, NY 11733.

INSTITUTIONAL SUBSCRIPTIONS TO THE KINGBIRD are \$18 to US addresses, \$23 to all others, annually on a calendar year basis only. Send orders to: Berna B. Lincoln, Circulation Manager, P.O. Box 296, Somers, NY 10589.

Send CHANGES OF ADDRESS, or orders for SINGLE COPIES, BACK NUMBERS or REPLACEMENT COPIES (\$5 each) to: Berna B. Lincoln, Circulation Manager, P.O. Box 296, Somers, NY 10589.

Magazines undelivered through failure to send change of address six weeks in advance will be replaced on request at \$5 each.

All amounts stated above are payable in US funds only.

Figure 1. Ancient Murrelet at mouth of the Genesee River, Rochester, New York, 4 November 1994. Photograph by Robert Marcotte.

PHOTOGRAPHS OF NEW YORK STATE RARITIES 63: ANCIENT MURRELET

ROBERT MARCOTTE

The morning of 31 October 1994, dead calm on Lake Ontario in a lingering warm fall, looked like a dull day for birding as I started the half mile walk out the Charlotte pier at the mouth of the Genesee River in Rochester. This impression changed abruptly when I spotted a murrelet just off the tip of the Summerville pier on the far side of the river. I began to sketch my impressions, then held my breath as two Coast Guard vessels churned by precariously close to the bird. However, it remained unconcerned by either the boats or a fisherman seated at the end of the pier only a few feet away.

Sensing the bird was not leaving immediately, I headed for the nearest pay phone to call Carolyn Cass and to alert the local birding grapevine, then home to pick up camera and field guides, and back to the Summerville pier. Recalling the previous fall's visit to the Moses Saunders power dam pool by a Marbled Murrelet (*Brachyramphus marmoratus*; Boyle *et al.*, 1994), I at first thought this might be another one. Close examination from the end of the Summerville Pier showed this bird was different. The bill was light, there was a pronounced contrast between the dark crown, upper face, and nape and a lighter gray back, and there were no white markings on the scapulars. It was an Ancient Murrelet (*Synthliboramphus antiquus*), a first for New York State! A later search through Harrison (1983) revealed the Crested Murrelet (*Synthliboramphus wumizusume*) from waters off Japan as the only other possible confusing species in winter. However, that species is shown with yellow legs and feet, and this bird's definitely were black.

Through the rest of the day, in spite of a rising chop on the lake and afternoon rains, local birders arrived to study and photograph the bird. It seemed to settle into a pattern of approaching to within a few feet of the end of the pier, frequently diving for small minnows, then drifting out to the northeast with less diving and more resting on the surface, preening, and stretching of raised wings. It would sometimes drift a hundred yards or more out and be lost to view. However, within every 15-20 minute period it would reappear from off the river mouth headed for the pier, again actively diving for 10-20 sec., and often resurfacing for only a few seconds. Behavioral observations included its total unconcern for fishing boats passing close by trailing lines and floats, an apparent aversion for the patchy areas of very muddy, brown water, and an

interesting habit of lying on the water with wings out flat and partially open, with head down, apparently looking for prey much as a Common Loon does. At times when it was diving a bit farther off the pier, Bonaparte's Gulls feeding in the area were seen to harass the murrelet when it popped to the surface. It easily avoided them with quick dives. In the approaching dusk around 4:45 PM, the bird swam out a final time. By that time about fifty birders had added a tick to their New York lists.

Tuesday and Wednesday, 1 and 2 November, brought rain and winds increasing to gale force from the north. Waves washed over the pier, closed to foot traffic. There were no sightings those days.

Thursday morning dawned bright and clear, with southwest winds and a low chop on the lake. In a quick check before work, Bob Spahn spotted a small bird of the right general size and shape a couple of hundred yards out, lit up in hues of orange by the rising sun. Back on lunch hour with Sue Spahn, they learned from fishermen that neither they nor a few visiting birders had found the bird during the morning. Yet, on arriving at the end of the pier, the Spahns observed the bird 50 yards or so away, heading straight for them. This time it was very actively feeding and finally worked its way a hundred yards or so in toward shore along the east side of the pier. In the relatively clear water, it was possible to observe some of its feeding behavior. It was pursuing minnows which would ball up, much like starlings with a hawk present. The murrelet, essentially flying under water, was seen to use its wings to make rapid twists and turns through the balls of minnows. After feeding inward along the pier, the bird would move off 50 yards or so and head back out, spending more time on the surface. While close in, it was so active that catching it on the surface for photos was difficult, but a half roll of film was shot by Spahn.

Again the word was passed and a few more birders were able to observe the bird through the afternoon. By this time more mud and debris were issuing from the river mouth. The next group arriving did not immediately find the bird, but observed it flying in from beyond the brown waters to again take up the feeding loop along the east side of the pier, now feeding nearly in to shore at times. The bird departed just before 4:00 PM after only another ten or so observers having viewed it.

On Friday, 4 November, the bird was present when the first observer arrived around 6:30 AM and put on quite a show for the many observers arriving from near and far. It followed the pattern of the previous day. The birders became a part of the show, surging up and down the pier, trying to get in position for good views or closeup photographs when the bird would pop up. Some of the fishermen were quite entertained by

the antics of both the bird, which some fishermen now called the "Ancient Mariner," and the birders. At times, photographers could focus by noting minnows leaping from the surface just before the bird would appear, minnow in bill. By early afternoon, the water, even along the pier, was becoming murkier. The bird drifted out of sight into the open lake just after 1:30 PM after being seen by about 50 more observers. The accompanying photograph was taken by the author between noon and 1:30 PM period this day.

On Saturday morning birders from all across the state arrived early, but muddy water surrounded the east pier and a heavy chop covered the lake to the west and out beyond the river's mud plume. The murrelet was not seen. Perhaps the muddy water eliminated its ability to sight prey. The bird was not observed again until presumably the same individual was seen flying past the observers manning a watch for migrating water birds at the Hamlin Beach State Park about 18 miles west of Rochester at 7:30 AM on Tuesday, 8 November. It landed to the west, but could not be located in the rough waters. On Sunday, 13 November, Willie D'Anna relocated presumably the same bird feeding around the piers extending into Lake Ontario at the mouth of the Welland Canal near St. Catherine's, Ontario, about 85 miles west of Rochester and 8 miles west of the mouth of the Niagara River. This provides a first record of a live bird for Ontario and a first there since a bird was found dead on the north shore of Lake Erie on 15 November, 1908 (Godfrey 1966:201). As many as another 100 birders were able to view the bird that day.

The Ancient Murrelet is generally a bird of the North Pacific, breeding in North America from the Aleutian Islands to southern British Columbia and casually to Carroll Island, Washington. It winters from the breeding grounds and coastal Alaska to small numbers along the central and even southern California and Baja coasts, often far at sea (AOU 1983:245). There have now been sightings from 22 states, seven of these east of the Mississippi, and six Canadian provinces, two of these eastern (White 1990). Only two reports have been from farther east than this current sighting, a 13 April 1913 record from Montreal (Godfrey 1966:201) and a 29 November 1992 flyby at Rockport, Mass. (Ellison and Martin 1993). The observations of this bird chasing and eating minnows seems to be a departure from their normal diet of marine invertebrates (Bent 1963:138).

ACKNOWLEDGMENTS

I would like to thank Robert Spahn for his contributions of personal observations on the murrelet's behavior, research of the historical information, and review of the manuscript.

UTILIZATION OF WILD APPLES BY WINTER BIRDS

LEE B. CHAMBERLAINE

The winter of 1993-94 was one of the most severe in the Northeast in recent times, with more cold weather than even the winter of 1992-93 with its blizzard. The impact of extreme temperatures and high snowfall on birds that attempted to winter and on winter visitors was clear. It was very apparent that a food supply that goes unused by birds until the late spring in many years was used heavily and early by many species of birds under these severe condition. This food supply is the fruit of old fashioned wild apple trees (*Malus* sp.) and, in particular, those varieties which retain fruit throughout the winter months. Usually these are wild trees that have small fruits, 1/2 to 1/4 inch or smaller diameter, and are not the ornamental and colorful flowering varieties.

I observed several species eating the pulp or the seeds from the trees and from fallen fruits on the ground. Species which ate the pulp were Red-bellied Woodpecker, American Robin, Bohemian Waxwing, Cedar Waxwing, European Starling, Pine Grosbeak, House Finch and Evening Grosbeak. The species which ate the seeds and at times rejected the pulp, especially as it dries out, were Pine Grosbeak and Evening Grosbeak. Red-bellied Woodpecker and House Finch eat apple fruits in the fall and I have seen them completely consume numbers of whole apples as large as three inches in diameter. Red-bellied Woodpecker forages individually while the House Finch devour apples as a flock. The action by these birds while feeding dislodges the fruits and makes this food supply available to other wildlife species such as cottontail rabbits, Ring-necked Pheasant, White-tailed Deer and various small mammals above and below the snow pack.

In years when the weather is not as severe, this frozen food supply is available to early returning American Robin and Cedar Waxwing. The apples remain frozen and fairly fresh in the cold months, thawing as temperatures moderate. This cold storage food supply is very important to the American Robin. Robins stay on a tree daily until the fruit supply is exhausted. Later they may go to the ground to eat the dried, fallen fruit during early spring snowstorms.

There is much activity at the base of these apple trees as other returning migrants take their turn on the seeds, dried pulp and green sprouts that later emerge from the missed apple seeds. None of these sprouts under the tree will grow for long, because apple trees secrete

chemicals that kill the new seedlings (allelopathy) before the seedlings grow very much. This is a way that many tree species protect themselves from competition by seedlings.

If you are looking for an ideal wildlife food tree or shrub, it would be hard to beat an old fashioned common apple tree. Upkeep is minimal and they are almost impossible to kill when fully established. Cut them back and they sprout profusely the following year. Most die from old age and heart rot if left to themselves untrimmed or maintained. In addition they serve Ruby-throated Hummingbird, House Wren, Eastern Kingbird, Gray Catbird, Cedar Waxwing, Yellow Warbler, Chipping Sparrow, Northern Oriole and House Finch as a food source while in flower or leaf. Cedar Waxwing often eat the flowers. Bark of young trees is a favored food of voles (*Microtus* sp.) and cottontails, so precautions must be made until the bark hardens with age. In deer habitat, fencing is a must for a few years at least. In addition when the apple trees bloom in May they provide a visual beauty and a fragrance akin to perfume.

These trees are not without negatives. The falling apples can create a mess and make late fall lawn mowing a difficult task. Old small dead branches drop off over the winter months and must be picked up every spring. The fallen apples left to rot and ferment in the fall attract large numbers of small yellow jackets, which can inflict a painful sting if provoked as by lawn mowing.

BREEDING BIRD CENSUS OF GOOSE CREEK MARSH, PELHAM BAY PARK, THE BRONX, NEW YORK

DAVID S. KÜNSTLER

Goose Creek Marsh is one of the largest salt marshes remaining in Bronx County, but its breeding birds have not been surveyed in 30 years. A brief breeding bird census of Goose Creek Marsh, a 65 acre (26.3 hectare) salt marsh to the east of the Hutchinson River and the Hutchinson River Parkway in Pelham Bay Park, northeast Bronx County, New York (lat. 40°52'N, long. 73°49'W) was conducted during mid June 1994.

METHODS

I censused Goose Creek Marsh on three dates. On 13 June, approximately one hour was spent in the northwest section of the marsh; on 16 June, about three and one-quarter hours were spent for the remainder of the marsh. This totaled about four and one-quarter hours for the entire marsh. However, due to a desire to get more detailed data from the northwest section, a second trip of 40 minutes duration was made there on 17 June. For the most part, the *Phragmites* was not entered for this count but many fewer birds could be expected there. Visits were made during low tide. Nikon Travelite III 9x25 binoculars were used. Weather was suitable throughout.

HABITAT

The various habitats of Goose Creek Marsh (Fig. 1) were broken down by the entitation carried out in 1986 (City of New York Parks and Recreation 1988; Sisinni and O'Hea Anderson 1993), from the lowest part of the marsh to the highest (Table 1). Botanical names follow Gleason and Cronquist (1991). The low marsh generally is flooded at each high tide and is dominated by Saltmarsh Cordgrass (*Spartina alterniflora*), with minor amounts of Slender Glasswort (*Salicornia europaea*). The tidal creek is another community, according to Reschke (1990), but it has been combined with the low marsh for purposes of this census. The open high marsh usually is flooded only once a month and is dominated by Salt Meadow Cordgrass or Salt Hay (*Spartina patens*) with Spike Grass (*Distichlis spicata*) and Sea-lavender (*Limonium*

Figure 1. Goose Creek Marsh. Photograph by David S. Künstler.

carolinianum), occasional patches of Black Grass (*Juncus gerardii*) and small amounts of Orache or Spearscale (*Atriplex patula*), the latter considered non-native by Gleason and Cronquist (1991) but native by Mitchell (1986). The salt shrub is dominated by the Marsh Elder (*Iva frutescens*) and Salt Meadow Cordgrass. This zone has low salinity. Higher up in the marsh is some occasional Groundsel-tree (*Baccharis halimifolia*). The highest part of the marsh receives little tidal flushing and is almost entirely dominated by Common Reed (*Phragmites australis*). The uplands surrounding much of the marsh support good quality oak-hickory forest, perhaps a combination of Appalachian oak-hickory forest and oak-tulip tree forest (Reschke 1990). There are also several New York State listed rare plants in and around the marsh. *Phragmites* has expanded inward into slightly lower areas of the marsh and the other ecological zones have shifted in the same direction. Thus, the net result may be that the acreage of *Phragmites* expanded, and the high marsh contracted with little change to the shrub acreage. This likely is because there is insufficient tidal flow through the culvert under the Hutchinson River Parkway. Another contributing factor could be the gradual sedimentation of the mosquito ditches which may previously have distributed more water to the marsh. The low marsh is probably little affected because most is along the tidal creeks with some vanishing remnants along the mosquito ditches.

Table 1. Community composition of Goose Creek Marsh

Community	Entitation Unit	Acres	Hectares
Low salt marsh	Unit 300	12.3	4.98
High salt marsh	Unit 301	26.2	10.61
Salt shrub	Unit 302	10.4	4.21
<i>Phragmites</i>	Unit 303	16.1	6.52
Total		65.0	26.32

Table 2. Breeding birds of Goose Creek Marsh

Species	No. pairs	Pairs/acre	Pairs/ha
Clapper Rail	1	-	-
Marsh Wren	20	1.92	4.75
Sharp-tailed Sparrow	6	0.58	1.43
Swamp Sparrow	15	1.44	3.56

RESULTS

The density of nesting pairs or territorial males of all but the Clapper Rail (*Rallus longirostris*) was based on the area of prime habitat, salt shrub (Table 2). Additionally, there were two sightings of Green Heron (*Butorides virescens*) in the creek, perhaps the same bird nesting in forest close to the marsh. Also, about four male Red-winged Blackbird (*Agelaius phoeniceus*) were seen. They may have had at least that many nests and females, but seemed only to be making temporary forays into the marsh. Willow Flycatcher (*Empidonax traillii*) was also heard, probably near the railroad tracks but outside the marsh.

DISCUSSION

Although only one Clapper Rail was heard, more were probably present. Clapper Rail is secretive and does not always make itself known. Also one was seen a few years ago at the Bartow-Pell Mansion vernal pond, where there is much less habitat. However, a regional decline has probably occurred, as exemplified by counts taken in the marshes of the Town of Hempstead. A 37-acre (14.6-ha) plot there supported 13 breeding pairs in 1966 held only four pairs in 1979 (Peterson 1988).

Marsh Wren (*Cistothorus palustris*) and both sparrows were almost exclusively seen in the salt shrub community. The Marsh Wren was the most commonly recorded marsh bird. They often made themselves obvious by virtue of their frequent singing and distinctive flight, low

with a significant rise and descent at the end as they broke into song. The domed brood nests built by females and dummy nests mostly built by males in the Marsh Elder sometimes were evident.

Sharp-tailed Sparrow (*Ammodramus caudacutus*) was never observed singing. One or two birds in a restricted area were assumed to represent a breeding pair. The nesting of the Sharp-tailed Sparrow seems to be synchronized with the spring tides so that the young are out of the nest before the monthly flooding of the high marsh (Lent 1988). Young (1958) found 121 pairs in the Pelham Bay Park area in 1955, and he considered this a likely underestimate. Though he also must have searched extensive marshes where Co-op City now stands, his number of birds, if more or less evenly distributed within the appropriate habitat, implies that the current density for Goose Creek Marsh is low.

Swamp Sparrow (*Melospiza georgiana*) was surprisingly common here. Bull (1964) stated that the Swamp Sparrow breeds in various types of freshwater wetlands and "more rarely in coastal brackish meadows." Arbib (1988) listed its habitat as "margins of freshwater marshes, grassy streambanks, reedbeds, large and small riverine areas, and less frequently the edges of salt marsh or salt meadow." As Bull (1964) observed, "Ordinarily only a few pairs are found nesting at a given locality..." However, he reported that 120 pairs had been found at Troy Meadows and 20 pairs at Idlewild. The Goose Creek population, therefore, may be among the larger ones in the New York metropolitan area, especially since the Idlewild population has long been extirpated.

In a large salt marsh such as Goose Creek Marsh, one might expect to find Seaside Sparrow (*Ammodramus maritimus*). Young (1958) found four pairs on the east side of the Hutchinson River in 1955. However, this species requires salt pannes for feeding, according to Jon S. Greenlaw (pers. comm.). Salt panne is a habitat that is essentially lacking in the high marsh and the low marsh, where these sparrows would be found. However, Carl Alderson (pers. comm.) has found only one of seven pairs using a third-acre salt panne in the Chelsea or Saw Mill Marsh in Chelsea, Staten Island.

Goose Creek is an important feeding ground for many birds that do not nest in the marsh itself. Many of these species do not feed in the marsh to any great extent during low tide when the census was conducted. Some of these species include Great Egret (*Casmerodius albus*), Snowy Egret (*Egretta thula*), Black-crowned Night-Heron (*Nycticorax nycticorax*), Canada Goose (*Branta canadensis*), and American Black Duck (*Anas rubripes*). Great Egret, Black-crowned Night-Heron, and, formerly, Snowy Egret probably come from nesting populations on Huckleberry Island in New Rochelle (Künstler and Capainolo 1987).

ACKNOWLEDGEMENTS

Thanks to Marianne O'Hea Anderson for reviewing the manuscript and Robert Bealin for his ideas and support.

CERULEAN WARBLER AND NORTHERN PARULA TENDING THE SAME NEST

PATRICIA LINDSAY AND TOM VEZO

A small isolated population of Cerulean Warbler (*Dendroica cerulea*) has occupied a section of the Northwest Woods in East Hampton, Long Island, during the breeding season for the past several years (Lindsay and Vezo 1992, 1994). In 1992, season long observations suggested probable breeding of three pairs of these warblers, and in 1993, two pairs were confirmed breeding when they were seen feeding young. The birds have remained generally faithful to a few specific territories in this area, with the two main territories being a little over a quarter of a mile apart. The warblers were found again in 1994, with sightings of an individual male near the more northern territory recorded on 23, 28 and 29 May by multiple observers. Later both a male and a female were seen there.

In the territory to the south, one sighting of a male was recorded by Jim Ash around 28 May, but subsequent visits produced no sign of a bird in this area. A visit by Lindsay on 4 June produced no observations of Cerulean Warbler at either location, but, curiously, a male Northern Parula (*Parula americana*) sang throughout the day from the southernmost territory. On the morning of 10 June, the Northern Parula still present and singing at this site. Here the authors observed a female Cerulean Warbler carrying small caterpillars and other insects to a fairly exposed nest nearby. One very young chick was visible in the nest. The female visited it with food every few minutes for the next three hours. During this time, the Northern Parula also visited the nest twice with food, with a long interval between visits. The last visit resulted in an apparent skirmish with the female Cerulean Warbler, which chased and displayed aggressively toward the Northern Parula. At 11:00 AM the Cerulean Warbler stopped feeding the chick and began brooding the nest, with the Northern Parula still singing a short distance away.

On 14 June it was discovered that the nestling was a Brown-headed Cowbird chick; a second, much smaller chick now visible in the nest had the coloring and supercilium of a young Cerulean. On this brief visit only the female Cerulean Warbler was observed feeding the young. The Northern Parula continued to sing nearby. On 18 June the nest was empty, and on this and several later visits, there was no sign of either adult bird nor of any young in the area.

The nest resembled that of the Cerulean Warbler shown in Harrison (1975:188). It was placed in the fork of a vertical branch of an oak tree

about 25 feet high over an open area. The female, after depositing food at the nest, would pull in its wings and drop like a stone through the open area to the understory below. No male Cerulean or female Northern Parula was observed in the territory during the course of these observations.

Although there was almost no evidence to suggest hybridization of these species in this particular case, the possibility is intriguing. Sibley (1994) illustrates many unusual combinations that have been recorded, two involving Northern Parula and one involving Cerulean Warbler. Northern Parula X Yellow-throated Warbler (Sutton's Warbler) is cited as an example of occasional cross-breeding, and Northern Parula X American Redstart and Cerulean Warbler X Black-and-white Warbler are listed in a sampling of "bizarre and unique" pairings recorded only once or twice. The possibility of hybridization notwithstanding, it may be that the absence of the Cerulean Warbler's original mate or the absence of a female Northern Parula, or the presence of the cowbird chick triggered an innate response in the Northern Parula to bring food to the nest. The fact that the Northern Parula was still present so late in the breeding season is noteworthy in itself. Bull (1974:477-480) notes that, though once common breeders on eastern Long Island, the Northern Parula was considered extirpated by the early 1950s, probably as a result of the disappearance of its favored nesting material, the *Usnea* lichen, there.

NEW YORK STATE WATERFOWL COUNT, JANUARY 1995

WALTON B. SABIN

The Federation of New York State Bird Clubs, Inc., held its 1995 winter Waterfowl Count from 14 through 22 January, with 15 January as the target date. All Regions completed their counts within the established dates.

THE WEATHER

An overly warm fall and early winter period continued into January 1995. Temperatures during the count period averaged about 8°F warmer than normal (20°). Precipitation averaged around 28% above normal (2.5 inches). Snowfall was very light, about 50% of normal accumulation, notwithstanding the heavy snowfalls usually received downwind of Lakes Erie and Ontario. A warming trend around 16 January prompted flood watches. On 20 January, flooding problems hit part of Region 1, with reports of rural road closures and flooding in the town of Albion, Orleans County. Water levels were above normal at practically all locations monitored by weather bureau observers.

THE COUNT

The grand total of 291,989 (Table I) was up 14.6% from 1994, and 14.3% above the 22-year (1973-1994) average of 250,234. Except for Brant, Redhead and the scoters, all species listed in Table II showed gains over 1994. It is disheartening to note a substantial decrease in Redhead. The Department of Environmental Conservation aerial count echoed this decrease as well. With the exception of two or three species, the downward trends of 1994 were reversed in 1995.

Comparing 1995 to 1994 count figures (Table II), the commoner species showed a 14-3 split heavily in favor of increases. Both Redhead and the scoters counts reversed themselves, showing decreases over 1994. When comparing 1995 count figures with the 22-year (1973-1994) average (Table III), there is a 7-6 split in favor of decreases. The overall total in Table III showed an 11.5% increase in 1995 over the 22-year average, up moderately from 1994.

The United States Fish and Wildlife Service midwinter waterfowl inventory showed all geese in the Atlantic Flyway (Maine to Florida) increased by 8.5% from 1994, mostly the result of a 61.0% increase in

Snow Geese. Brant and Canada Geese had decreases of 5.6% and 5.0% respectively. The dabbling ducks showed a decrease of 5.2% from 1994, after a 20.2% increase recorded last year. All species were down, with the exception of American Black Duck, which was up 1.6%. Diving ducks, including sea ducks, showed an overall increase of 12.8% compared to 1994. A few bright spots here were 60.0% increases for scaup over 1994, 40.0% for goldeneye, 39.9% for Bufflehead, 83.2% for Ruddy Duck, and 53.4% for mergansers. American Coot showed a 14.0% decrease from 1994, and a 22.3% decrease from the most recent ten-year average. Most American Coot again were wintering in the Carolinas, Georgia and Florida. In summary, waterfowl in the Atlantic Flyway were up 5.3% from 1994, and 22.2% above the 1985-1994 average.

The New York State Department of Environmental Conservation 1995 aerial survey was conducted from 4 to 29 January 1995. The results are presented in Table IV. Table V compares the 1994 to 1995 aerial survey results. As in most years, the 1995 New York State Department of Environmental Conservation aerial count did not, in a general sense, resemble the Federation's ground count.

I wish to thank the upwards of one hundred observers who participated this year. A special thanks to the Regional Compilers who coordinated all those volunteers. The Regional Compilers were:

- | | |
|-----------------------------|----------------------------|
| Region 1. Joseph DiDomenico | Region 6. Lee Chamberlaine |
| 2. Thomas Smith | 7. John Peterson |

NOTES AND OBSERVATIONS

First successful nesting of Double-crested Cormorant in the Niagara Frontier Region: During the 1994 breeding season Double-crested Cormorant produced nestlings at two different colonies in the Niagara Frontier Region. This represents the first documented nestlings of this species in this area. Although the colony at Buckhorn Island State Park was studied weekly from 14 April to 10 July and on 29 May as many as 38 adults were observed sitting on 38 of the 46 nests studied, no evidence of any young was observed and weekly observations were terminated by the author when the colony appeared to be abandoned on 10 July. On 16 June, Senior Wildlife Biologist Mark Kandel of the New York State Department of Environmental Conservation investigated the contents in ten of 52 nests. Although two of the nests were empty, the other eight nests contained twelve eggs and eleven chicks. The author believes that none of the chicks lived beyond 10 July, and that further study is needed to determine why a colony of this size did not produce viable offspring. The NYS DEC recorded 3,436 pairs of Ring-billed Gull nesting on the same water diversion weir as the cormorants. At the Reef Lighthouse, between Lake Erie and the source of the Niagara River, an adult Double-crested Cormorant was observed in incubating position on one of two nests on 11 August and 22 August. Each of these nests was located at the intersection of three steel beams of this manmade structure. On 31 August and 5 September, three nestlings were observed on the nest. Food begging rituals were observed on or near the nest 18 September and 1, 8, and (briefly) 18 October. The most interesting performance was noted on 8 October, when, after an adult landed near the nest, a young cormorant approached it and prodded its bill back and forth across the pouch of the adult. The adult typically evaded the young cormorant's prodding with a sinuous winding snake like action of its neck. This time, however, the adult stretched its neck as far to the right as possible to avoid the advances of the tenacious young, which powered itself with its wings up the back of the adult and continued to poke at the pouch of the adult. After about two minutes of this activity, the young finally turned the adult around and thrust its head down the adult's throat for food. The young cormorant then returned the nest where it met another young cormorant on the nest. The young cormorant on the nest then poked back and forth across the pouch of its sibling, but did not appear to be successful in obtaining food. The author believes that these birds fledged successfully. These observations represent the first documented successful nesting of Double-crested Cormorant in the Niagara Frontier Region. The Reef Lighthouse nesting is extraordinary in that it was very late. Dates for unfledged juveniles in New York State should be extended to June 16 and October 8 based on the observations at Buckhorn Island State Park and the Reef Lighthouse.

William Watson, 771 Fletcher Street, Tonawanda, New York 14150.

Boat-tailed Grackle at Shinnecock, Long Island: A young Boat-tailed Grackle (*Quiscalus major*) was seen being fed by an adult female on 3 July on Dune Road near the Ponquogue Bridge, Shinnecock Bay. Since the young bird was already flying, it is not absolutely certain that the species bred in the area. However, this area is a considerable distance northeast of the nearest known breeding grounds in Nassau County, and there is ample evidence that the species is in the process of colonizing Shinnecock Bay. A single male was seen nearby area in May by Hugh McGuinness in almost the same location. A small flock of at least nine female or immature plumaged birds was active by the bridge all summer. This flock seemed to consist entirely of molting juveniles, with noticeably larger males showing areas of flat black plumage mixed with the brown by the middle of September. Young males are brown before they assume the black first Basic plumage shown in the field guides and incorrectly labeled "juvenile". The Prebasic molt was complete by the end of September and an adult female as well as juveniles of both sexes were still present in the area well into October. The appearance of this flock and the predominance of young birds appears to be typical of the pattern of the range expansion northward shown by this species in other areas.

Eric Salzman, Box 775, East Quogue, New York 11942

Cedar Waxwing flock composition at Kestrel Haven Migration Observatory, Schuylar County: During our fall migration banding in 1994, we were visited by two flocks of approximately 100 Cedar Waxwing each. Both flocks remained for several weeks, providing many opportunities to count and age the birds on the wing. In addition, a high percentage were banded. The waxwings were attracted to an abundant supply of pokeberry and mountain ash berries, showing a distinct preference for the former. We noted several Hatching Year birds with orange tail bands, which may be indicative of nestling diet, four adult females with the normal yellow tail band and one Hatching Year bird that was molting from orange to yellow tail band color. The flock composition was 98% Hatching Year birds, accompanied by two adult females. Both flocks were of equal size and composition, which suggests that young birds may congregate under the tutelage of a few adult females. The waxwings remained at our site until they denuded the available pokeberry. Subsequently, a large wintering flock of 250 adults appeared and remained in this area through February 1995. It will be interesting to learn whether flocks primarily of juvenile waxwings form during the fall in other years and at other localities.

John and Sue Gregoire, Kestrel Haven Farm Migration Observatory, 5373 Fitzgerald Road, Burdett, New York 14818-9626

HIGHLIGHTS OF THE SPRING SEASON

ROBERT SPAHN

The spring of 1995 brought very interesting birding all across the State. It was generally dry to near drought everywhere, with April in Region 4 the only month that specifically indicated even slightly above average precipitation. Most reports showed rainfall 1/3 to 2/3 the norm. This generally produced easy conditions for birding. March started the season on a warm note, following on the heels of a very warm winter. That combination brought a scattering of record early arrival dates across the State. April was cold, most nearly average in Region 10, with north winds much of the time over most of the State delaying some migrants and damping hawk flights in the western part of the State. May warmed to nearly average temperatures over most of the State, a bit cooler in Regions 6, 7, 8, and 9, with the little rain that fell coming in bursts after cool spells which had dammed the flow of migrants for days. Storms crossing the State 10 through 13 May after a long cool spell produced some of the best migrant fallout in many years, and many high counts for a wide variety of species were obtained. Lesser, more local, but still impressive birding days were noted 17, 19-21, and 24 May.

This season is the most difficult I have had to summarize. The lists of high counts and early arrivals to be checked relative to published extremes and the many rarities are the most in nearly 20 years. This season's records will drive many of the authors of the next *Bull's Birds of New York* back to their manuscripts to add extreme dates and maxima. In this limited space, it is impossible to list all here without simply repeating the Regional Reports. Thus, I am forced to attempt an analysis plus provide a quick taste of some of the wealth of information contained in the Regional reports. The reader should remember several cautions. First, we are now 20 years past the publication of John Bull's *Birds of New York State* and there is not sufficient time to check all *Kingbird* issues for the extreme dates and counts, so my comments will be relative to Bull's information and my fallible memory of the intervening years' data. Next, there is variation in the degree of experience, interest, and screening applied to records among the Regional Reports. This summary is an additional, informal filter evident in my commentary or the lack thereof. Finally, high counts are difficult to compare both between Regions and with historical reports, because the effort expended and the area covered usually are not indicated. I generally refer the reader to the specific Regional Reports for comparisons over time by that Regional Editor. In most cases, it may be assumed that high counts are from individuals or single parties at one place, but not all single site tallies are distinguished from totals obtained by a group covering many sites in a Region. *It is relatively hard to gather*

numerical data about to bird populations that are both comparable and useful over time and space. We perhaps should treat these reports as much as fun and an aid to knowing when and where to enjoy birds as an attempt to gather scientific data.

Starting with the water birds, and at sea at that, the Region 10 report summarizes a fantastic, late winter pelagic trip. Highlights include State record highs for Northern Fulmar, *Common Murre*, and *Atlantic Puffin* and large numbers for other species plus an encounter with *Great Skua*. Otherwise, loon and grebe counts were not particularly good, but Region 2 did record a *Pacific Loon* and Regions 5 and 10 noted Eared Grebe, in the latter case in the company of both Horned and Red-necked Grebes. Inland, numbers of Double-crested Cormorant eclipse those in Bull's book, 3120 the peak this year found in Region 5. The warm winter and early March saw open water at early dates in many Regions. Waterfowl responded well, with many species returning early and also on their breeding areas early. Inland regions noted better variety and numbers than for many springs. Highlights include the continued appearance of Greater White-fronted Goose, with birds in Regions 1, 2, 5, and 9; a *Ross' s Goose* in Region 7; *Barnacle Goose* in Region 2; Snow Goose in every Region, with particularly good counts in Regions 3, 4, 5, and 6; a first nesting of N. Shoveler in Region 9; Eurasian Wigeon in seven Regions, lingering to late May in Region 3; Harlequin Duck upstate in Regions 2 and 3; unusual many inland reports of Surf and Black Scoters for spring; and a Common Goldeneye with a brood on the water by May in Region 7. Negatives included low counts in multiple Regions for Brant, Blue-winged Teal, Canvasback, and Redhead.

Wading birds were well represented. Herons and egrets continued the flow of interesting records, with the best a first confirmed upstate nesting of Great Egret in Region 1; Snowy Egret in Regions 1, 2, 3, and 4; Little Blue Heron in Region 5; *Tricolored Heron* in Region 3; Cattle Egret in five regions; and Green Heron at a State record early date in Region 4. *King Rail* was found in Regions 2 and 9; and *Sandhill Crane* produced records from Regions 1, 2, 5, and 10. Shorebirds had mixed reviews. The dry spring brought habitat to some Regions usually lacking it, with many very early arrivals and many species not reported in years. In other Regions, habitat was reduced to dried field puddles. Montezuma National Wildlife Refuge in Region 3 and the Iroquois National Wildlife Refuge complex in Region 1 contained drawn down pools that attracted excellent concentrations at times. Still the overall picture was not very good for many species, such as Short-billed Dowitcher. Hitting only the cream of the highlights, we find the *Northern Lapwing* present to mid Mar in Region 10; record early dates for Upland Sandpiper in Region 7 and for Least Sandpiper in Region 9; over 2000 Dunlin in Region 3; and a

Curlew Sandpiper in Region 10. Jaegers, gulls, and terns provided several interesting notes, with a very rare *Long-tailed Jaeger* in Region 10; Laughing Gull upstate in Regions 1 and 2; several great spring counts for Little Gull in Region 1; Common Black-headed Gull in Regions 1 and 9; *Ross's Gull* in Regions 2 and 10, the former a Regional first; Lesser Black-backed Gull in Regions 2, 3, 8, and 9; Iceland Gull through late May in several Regions; Caspian Tern early in Regions 1, 2, and 5; record early inland arrivals for Forster's Tern in Region 2 and for Black Tern in Region 1, with very high counts for recent years of Black Tern in Regions 1 and 6. The latter counts may be anomalies. The species remains in serious trouble in the Northeast in general and New York in particular.

The cold north winds of late March and April reduced the numbers of raptors reported, particularly at the hawk watches in western New York, yet Derby Hill set high counts for many species and many other excellent records flowed in across the state. The most interesting were the peak Turkey Vulture count in Region 2; record early Osprey at Derby Hill in Region 5 and a high May count in Region 2; high counts for Northern Harrier along the south shore of Lake Ontario; a continued drop in Sharp-shinned Hawk totals; a good peak Cooper's Hawk at Derby Hill; *Swainson's Hawk* at both Derby Hill and Braddock's Bay; State record high totals both for one day and the season for Red-tailed Hawk at Derby Hill; a very high Golden Eagle count in Region 3; an inland record high total of 53 Merlin at Derby Hill; and *Gyr Falcon* persisting to March in Regions 1 and 7. There were more owl reports than typical, with Barn Owl in Regions 1 and 9, a lone Snowy Owl from Region 5, Short-eared Owl noted in nine Regions, and N. Saw-whet Owl in seven Regions.

Ring-necked Pheasant reports were all negative, but Wild turkey populations are still expanding. Spruce Grouse was located at a historic site in Region 6. Another notable game bird was a *White-winged Dove* in Region 10. Cuckoo numbers, especially Yellow-billed, were good in most Regions. Goatsuckers continue their declines. There were generally few comments about woodpeckers.

As usual, the huge passerine order produced a wide variation in impressions from across the State. There were a very large number of early dates, very high counts, and some spectacular fallout, of warblers in particular, in April in Region 10 and during the 10-13 May period nearly everywhere as a major frontal system passed after a period of weather unfavorable to migration. These are not reasons for great optimism! Apart from the moments of great excitement, often highly local, the season featured many days with nearly empty woods and fields.

Arrival Dates Seasonality and Advance

Region	Species Reported	Seasonality (days)	Advance (days)
Region 1	92	1.2	-0.9
Region 2	93	2.4	-1.5
Region 3	92	-2.3	-3.3
Region 4	87	0.3	2.3
Region 5	93	-2.4	-2.6
Region 6	89	-2.0	5.9
Region 7	89	-4.6	4.2
Region 8	92	-2.8	-0.7
Region 9	61	0.5	-0.7
Region 10	73	2.2	-2.8

Seasonality measures the average difference (in days) between this year's arrival dates and the long term average dates for the *same* Region. *Advance* measures the average difference between this year's arrivals dates in one Region and the arrival dates averaged over all ten Regions. Negative values mean early.

The arrival date tables barely reflect these trends. After deleting the dates likely to be overwintering birds and the incredible dates reported without details in the Regional reports [*Editor's note* —the final tables were not available to the Highlights Editor, but the preliminary results closely resemble those in final version], we find arrivals very close to our recent 8-year averages for both water birds and land birds. Only the average date for land birds is significantly later this year than last year's. Among the individual species, only Solitary Sandpiper, Great Crested Flycatcher, Tree Swallow, and Cape May Warbler were statistically significantly late, and only Eastern Wood-Pewee, Solitary Vireo, and Northern Waterthrush were early.

As usual, many families and species received too few reports to indicate trends, so we can move along to a few of the best, including mixed reviews for flycatchers and swallows, but Yellow-bellied Flycatcher noted scarce everywhere reported; several Regionally early swallow arrivals; Fish Crow continuing to expand inland in Regions 3, 4, 5, and 8; Common Raven increasing, noted in seven Regions; Carolina Wren numbers remain down; Sedge Wren in Regions 4 and 6, the former the first report in over 15 years; record early Swainson's Thrush in Region 7; a record high for Wood Thrush in Region 5; the peak American

Spring Arrivals 1995

Bold Regional Record Early

Italics Also isolated earlier report(s).

Robin count past Derby Hill in Region 5; a Varied Thrush in Region 10; and *Loggerhead Shrike* reported only in Region 8.

There are so many special vireo and warbler records that only rarities and extremes for the State can be noted here. White-eyed Vireo appeared in five Regions; Solitary Vireo set a high in Region 1, but an amazingly early bird in Region 7 was unaccompanied by details. Also early were Yellow-throated Vireo in Region 10; Warbling Vireo in Region 3, while Philadelphia Vireo set a spring high in Region 5. Good Yellow Warbler counts came from Region 3 and Region 5, and a late March Yellow Warbler report from Region 4 was a month ahead of the next record, which also broke the former Regional record. Also early was Cerulean Warbler in Region 1. The 252 Magnolia Warbler banded on one day in Region 2 must have kept workers busy. Other exceptional counts were obtained for Black-and-white Warbler in Region 2 and for Hooded Warbler in Region 1. Unexpected were Orange-crowned Warbler in six Regions, an *Audubon's Yellow-rumped Warbler* in Region 3, *Yellow-throated Warbler* in Regions 7, 8, and 10; Kentucky Warbler in six Regions; and Connecticut Warbler in five Regions. Again, there were too many other very high counts and early dates to do justice to all. Nearly every warbler was noteworthy somewhere. Very low Tennessee and Cape May Warbler counts produced concern in many Regions.

A record high for Scarlet Tanager came from Region 5. Early Rose-breasted Grosbeak was noted in Region 6, but an extremely early Indigo Bunting in Region 3 could have overwintered at a feeder. Unexpected were Regional firsts for Clay-colored and *LeConte's Sparrow* in Region 4; *Blue Grosbeak* and Dickcissel in Region 5; Western Meadowlark in Region 1. White-crowned Sparrow set a record high in Region 5, which had huge two day mid March counts for Red-winged Blackbird, Common Grackle, and Brown-headed Cowbird at Derby Hill. Yellow-headed Blackbird was noted in Regions 1 and 3 and *Brewer's Blackbird* in Regions 2 and 3. The winter finches were scarce except for crossbills in the northern Regions, with Region 7 noting breeding and a mix of Red Crossbill subspecies identified from specimens gathered from roadkills.

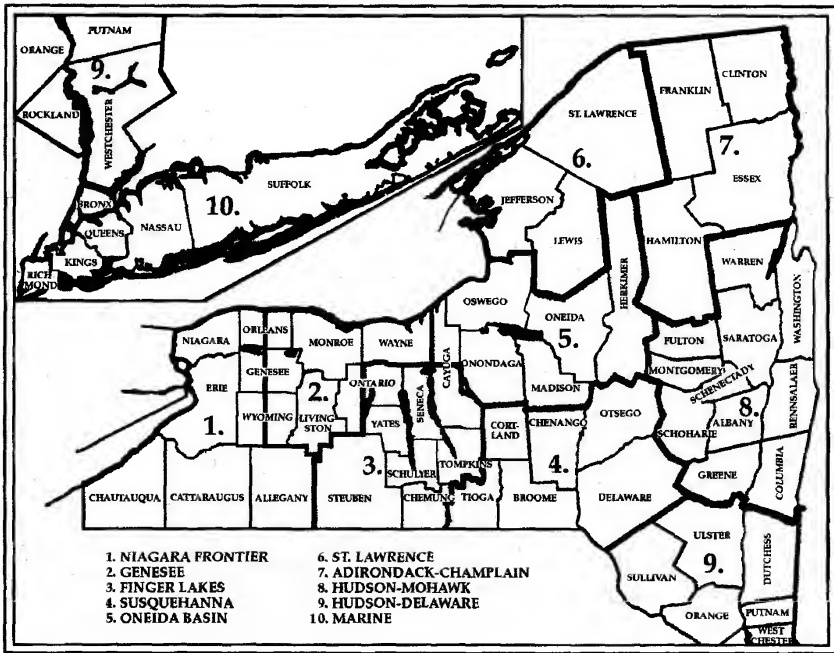

The tally of Peregrine Falcon nest sites around NYC appears in the Region 10 report. In the Region 1 report, find note of successful foster brooding of a nest of Eastern Bluebird. In Region 6, lots of Grasshopper and Henslow's Sparrows were found on night surveys. A ground nesting American Robin is described in Region 7.

With so many notable reports, no single species stands out as the highlight of this season, but the flashback provided by many species on at least a few days at a few locales in all Regions this spring brought happy remembrance of their former abundance.

716 High Tower Way, Webster, New York 14580

Standard abbreviations: Regional rarities appear in *bold italics*; county names are shortened to their first four letters and appear in UPPER CASE letters; months are shortened to their first three letters. **In species accounts:** number of individuals omitted implies that one individual was reported; ! — details seen by Regional Editor; ad — adult; Alt — Alternate plumage; Am. — American; arr — arrival or first of season; BBS — Breeding Bird Survey; Com. — Common; E. — Eastern; FL — fledgling; I — Island; imm — immature; *intro* — see introduction to report; juv — juvenile; L — Lake; max — maximum; mob — multiple observers; N. — Northern; NWR — National Wildlife Refuge; NYSARC — report to New York State Avian Records Committee; P — Park; Pd — Pond; ph — photographed; Pt — Point; Res — Reservoir; SP — State Park; spm — specimen; subad — subadult; T — Town of; Twn — township; W. — Western; WMA — Wildlife Management Area; y — young.

REPORTING REGIONS

Regional boundaries coincide with county lines, *except at:*

Region 1-Region 2 in Orleans, Genesee and Wyoming Counties: the boundary is NY Route 98 from Pt. Breeze to Batavia, NY Route 63 from Batavia to Pavilion, and NY Route 19 from Pavilion to the Allegany County line.

Region 2-Region 3 in Ontario County: the boundary is Mud Creek to NY Route 64, NY Route 64 from Bristol Center to S. Bristol Springs, and Route 21 from S. Bristol Springs to the Yates County line.

Region 3-Region 5 in Cayuga County: the boundary is NY Route 31.

REPORTING DEADLINES

Winter Season: December, January, February

Deadline is 7 March

Spring Season: March, April, May

Deadline is 7 June

Summer Season: June, July, August

Deadline is 7 September

Fall Season: September, October, November

Deadline is 7 December

REGION 1 — NIAGARA FRONTIER

WILLIE D'ANNA

March was mild, dry, and sunny. Temperatures averaged 4°F above normal while precipitation was half of normal. Notably, there was only one significant weather event, a cold front on the night of 6-7 Mar which lowered the temperature 32° and brought rain, sleet, and wet snow. A very mild period from 11 to 16 Mar helped to thaw shallow pools and to bring many waterfowl into the Region. Steve Eaton stated that this was the worst year for foods of woody plants on the Allegany Plateau in 45 years of observations. He noted that birds flocked to feeders in March, especially American Goldfinch and Purple Finch. The latter was noted in unusually good numbers by other observers as well. Often under the influence of high pressure, April was 3° cooler than normal and also dry, with half the normal amount of precipitation. The migration progressed at a trickle until late in the month. Significant movements were noted on 22 and 27 Apr. May temperatures averaged normal and precipitation was 0.75 inches below normal. By early in May nearly all of the ponds in fields had dried, giving shorebirds few locations to rest and refuel. The warbler migration began slowly but strong migration was noted on 10, 18, 21, and 24 May. For the three month period temperatures averaged nearly normal but it was the driest spring in 24 years. In spite of the general lack of severe weather, conditions for migration were often unfavorable due mainly to northerly winds or low pressure systems to the south of our Region. This delayed arrivals and peak movements of many species, which in turn contributed to some high maxima when conditions became more conducive to flight.

The waterfowl migration was generally uneventful, with average to below average numbers. However, on the Buffalo Ornithological Society's April Count, which also includes part of Ontario, Wood Duck was at an all time high while Oldsquaw and Bufflehead were well above average. The hawk migration produced few good days and no significant flights of Broad-winged Hawk. Single day high counts were made for Osprey and Turkey Vulture in the Town of Hamburg ERIE, however. As mentioned, the migration of many passerines and some water birds was delayed. Yellow-rumped Warbler was relatively scarce until the last few days of April, when several observers noted high numbers including a record count. A record count also was tallied for Palm Warbler late in April. Shorebirds, held back by weather and with few places to feed, were impressively concentrated at Wood Marsh on

the Tonawanda WMA. This pool, and Goose Pond on the Oak Orchard WMA, were drained at the right time by NYSDEC personnel to provide what were almost the only good mudflats known in the Region.

The Bald Eagle success story continues, though fitfully. In 1994 a pair showed interest in an Osprey nest on the Allegany Reservoir but abandoned the attempt. This year they tried to nest. Birders watched the pair with high hopes. By the end of the period, however, they were still incubating and it appears that their eggs may have been infertile. Another pair on the Cattaraugus Indian Reservation near Gowanda apparently was successful in fledging young last year. Reports on their status this year were not received. The Region's original nest in the post-DDT era at Iroquois NWR had two nestlings by the end of the period. In this tenth straight year of activity at this site, a camera was installed directly over the nest enabling thousands to enjoy an intimate view of the eagles' activities.

Another species on the rebound, Common Raven, also continues to do well. A fledged juvenile was reported and a phenomenal 17 were unofficially tallied on the Buffalo Ornithological Society's May Count, all in ALLE and CATT. It seems only a matter of time before they will also be found in WYOM, where habitat is plentiful but observers are few.

Bill Watson continues to monitor the water bird colonies of the Niagara River and elsewhere in the Region. This spring, while observing the Great Blue Heron and Black-crowned Night-Heron colony on Motor Island, he noted the presence of Great Egret. From his vantage point a half mile away, Bill determined that two pairs probably were nesting on the island. Although he could not see a nest through the woody vegetation, the consistent location of the birds as well as other behavior makes it very likely that at least an attempt has been made. If confirmed, which Bill hopes to do during the summer season, this would represent the first breeding record away from coastal areas in the state.

Vivian Pitzrick, who tends a bluebird trail in ALLE, found five nestling Eastern Bluebird, apparently unattended and near death. She moved the birds to a nearby box on top of four eggs, later found to be infertile. The next day the nestling bluebirds were noisy and active and the adopted parents acted aggressively at her approach. They had readily accepted their new charges!

Among a long list of rarities the following were seen on only one day: Snowy Egret, Greater White-fronted Goose, Eurasian Wigeon, **Sandhill Crane**, **Western Sandpiper**, Red-necked Phalarope, Laughing Gull, Kentucky Warbler, and Connecticut Warbler. The two warblers were at Goat Island NIAG on the same day. Among the few cooperative rarities

were an overwintering **Gyr Falcon**, Common Black-headed Gull, and Yellow-headed Blackbird. Finally, Betsy Potter has spent countless hours over the years scouring the pine plantations of the state parks along Lake Ontario in our Region for N. Saw-whet Owl. She is aware that her efforts would be rewarded more frequently in Braddock Bay SP, outside the Region. Still, she persists here and this spring she was rewarded with a *Barn Owl*, the first presumed migrant in the Region since 1986.

REGION 2 — GENESEE

KEVIN C. GRIFFITH

It was a varied and interesting spring season. For the most part the season was dry. March's precipitation of 1.15 inches was barely half the norm, and April's precipitation at 1.18 inches was 45% the norm. May was a little better with a reading of 1.75 inches, almost an inch below normal. The many precipitation free days were good for birding but hard on crops and vegetation. Temperatures were variable but close to normal overall. March was warm at 38.5°F, 4.2° above normal. April's 41.6°F average was the opposite, 4.3° below normal. May was nearly average at 57.2°F. March and April winds were predominantly northerly. This didn't seem to alter the migration drastically, and arrival dates were average or a little early relative to long term averages. May was a very interesting month. The month began as a near disaster in terms of passerine migration. North winds prevailed and nothing seemed to be moving. On 10 May, things changed dramatically. It seemed as though the early days had caused a backup of birds and when conditions improved, everything moved at once. A light overnight rain caused the birds to be grounded. Numbers were reminiscent of years past. There were good numbers of species and good total numbers for individual species at many locations.

Elizabeth Brooks again directed the passerine banding operations at Kaiser-Manitou Beach Banding Station. As was consistent with the migration, there were some very good banding days. A single day record was set as well as a number of daily highs for individual species.

Rob Clemens manned the hawk watch at Braddock Bay this year. He stated that, if weather conditions might have been more favorable, this probably would have been a record breaking year. The hawk watch suffered somewhat because the flights were somewhat dispersed by unfavorable winds. Lake effect winds also contributed to this condition. The total of 42,207 hawks was 12% below average. There were good totals for Turkey Vulture. Bald Eagle, Northern Harrier, Golden Eagle, and Peregrine Falcon. Broad-winged Hawk and Sharp-shinned Hawks were especially scarce. Broad-winged Hawk totals were 38% below average, which contributed to the low total count.

The season had many highlights and low points. There were some good loon flights this spring, but in general totals were not very high. A *Pacific Loon* was a highlight. Grebe arrivals were about normal, but once again the totals were low. Of interest were the low counts of

Double-crested Cormorant. Except for a couple of days with counts of 200, counts were off a bit. This species has been gradually increasing in the Region. Herons and egrets were very scarce. American Bittern, Black-crowned Night-Heron, and Green Heron were very hard to find. There were few wandering egrets to be found, with only one Snowy Egret and a few Great Egret. The only other highlight was Glossy Ibis.

Waterfowl were most interesting. While the regular species seemed to depart a bit early this year, there were some very unusual sightings. Greater White-fronted Goose has become somewhat regular in spring. A *Barnacle Goose*, as is always the case, is of uncertain origin, though it appeared to be wild. Also spotted were Eurasian Wigeon, Harlequin Duck. Scoters and Oldsquaw were reported on Lake Ontario through the season.

The usual few reports of *Sandhill Crane* came from the hawk watch. Sora and Virginia Rail numbers seemed about normal, and a *King Rail* was reported. The variety of shorebird species reported was about average, but numbers were down. There was some suitable habitat in May, but no major flights materialized. Dowitchers were scarce. Dunlin totals appeared to be good. Gulls and tern picture were mostly lackluster. The highlight was the Region's first *Ross's Gull*. Also of interest were Lesser Black-backed Gull and Laughing Gull. The local populations of Black Terns seemed to be down.

Wild Turkey continued to be well reported, but Ring-necked Pheasant was very scarce. It was a good spring for Yellow-billed Cuckoo, even though it arrived late. Long-eared and Northern Saw-whet Owls were found in Bergen Swamp in May. Whip-poor-will reports were up this year, but it was still absent from former breeding locations. Common Nighthawk numbers were down.

Reports of passerines were quite varied. There was a slight increase in Olive-sided and Least Flycatcher reports, but Yellow-bellied Flycatcher seemed to be scarce. The last building at the west spit of Braddock Bay where the Cliff Swallow nested burned this spring. Attempts by Cliff Swallow to nest on other buildings were met with apparent displeasure by the homeowners and their nesting attempts were thwarted. Sedge Wren was not reported. Kinglet reports were about average. Thrush totals were only fair, but Gray-cheeked and Swainson's Thrushes appeared well into the season. Brown Thrasher reports were good. Loggerhead Shrike was not reported, but there was a late Northern Shrike.

Vireo reports, with the exception of Philadelphia Vireo, were generally good. There was a single White-eyed Vireo report. Warblers

were very interesting. There were few late April reports but things were very good during a 10-15 day period in mid May, especially 10, 11t and 17 May. The usual uncommon species were reported. Most observers commented on the high numbers of Blue-winged, Nashville, Magnolia, Black-throated Blue, Black-and-white, and Black-throated Green Warblers, and Ovenbird. Good numbers of other species were also noted. However, numbers still are as high or consistent as were totals in the 1970s and earlier. The flight days this season were more concentrated in the past. Yellow-breasted Chat went unreported.

There were good reports of tanagers, grosbeaks and Indigo Buntings. Sparrows had no real highlights but numbers of some species were noteworthy. Vesper, Grasshopper and Henslow's Sparrows continued to be scarce. White-throated and White-crowned Sparrows were common only on a few days. Lincoln's Sparrow was noted in good numbers over a wide range of dates. A single male *Brewer's Blackbird* was observed at a site that was frequented by a pair in past years. The usual number of Orchard Oriole reports came from the west lakeshore and Northern Oriole was well reported. Purple Finch was quite scarce and virtually no other winter finches were reported. There were a few Pine Siskin and only a couple of Evening Grosbeak.

61 Grandview Lane, Rochester, New York 14612

REGION 3 — FINGER LAKES

STEVE KELLING

Weather in the Finger Lakes Region from March through May continued a trend of little precipitation that produced near drought conditions. Unlike the previous two years, there was no significant snowfall in March. Only between 3 and 7 inches of snow fell, and total precipitation was 1 inch below normal. Water levels in rivers and creeks throughout the Region, in particular the Chemung River, were already beginning to be abnormally low. A high pressure ridge situated over the entire eastern United States from 12 to 18 Mar was the most significant weather factor for the month. Precipitation levels in April were 1 to 2 inches below normal, and river and stream water levels were now significantly below normal. The month was unseasonably cool, averaging 3 to 6°F below normal. While winter weather conditions prevailed during the first week of the month, there were no significant frontal passages through the Region. Temperatures in May continued on the cooler side but not nearly as cool as April. Precipitation was between 1 and 3 inches below normal. A major weather disturbance on 10 May, when a series of thunderstorms passed through the Region, was the most significant weather event for the month.

The dry, cool weather conditions appeared to have influenced bird migration into and through the Finger Lakes Region. Herons, egrets, and shorebirds arrived earlier than their usual, while flycatchers, thrushes, and warblers tended to arrive on their average date, and swallows arrived later. Water levels were low, due to the light snow melt, lack of precipitation, and low water levels that were maintained at Montezuma National Wildlife Refuge, and at Cayuga and Seneca Lakes. Consequently habitat used by herons, egrets, and shorebirds was available early. The cooler than average temperatures in April may have prevented the early arrival of passerines. For example, in 1995 daily point counts at the Cornell University Plantations and the Laboratory of Ornithology at Sapsucker Woods recorded few species and low numbers of passerines until the second week in May. Counts made last year in the same areas recorded large numbers of both species and individuals in the last week in April and first week in May.

Several weather related events initiated exciting bird activity. The arrival of a high pressure ridge over the eastern portion of the United States in mid March brought an unprecedented number of Golden Eagle over the Mt. Pleasant hawk watch near Ithaca. The other significant

weather event occurred 10 through 13 May. The aforementioned line of thunderstorms and southerly winds created fog conditions throughout the Region. The consequence of this was a large fallout of migrating passerines and an influx of southern birds. Point counts at the Cornell Plantations recorded only 5 or 6 warbler species until 10 May. Afterward over a dozen species and numerous individuals were observed. This weather event also brought several bird species that are more commonly associated with more southern areas, including *Tricolored Heron*, Snowy Egret, Cattle Egret, Whip-poor-will, and Yellow-breasted Chat.

The managers of the Montezuma National Wildlife Refuge can be credited with producing excellent habitat during the late spring shorebird migration period. Beginning the first week of May, water levels in Tsache Pool were lowered. This created a huge mudflat that by the end of May held shorebirds in numbers and variety that have not been seen in some time. A total of 21 species of shorebirds were reported from the drained pool. The most numerous species was Dunlin. Several uncommon species were also observed, most notably American Golden-Plover, *Western Sandpiper*, and *Willet*. It is hoped that the managers of MNWR are pleased with these totals, and will continue to provide crucial shorebird habitat.

A total of 232 species of birds were observed this season. In addition to the aforementioned reports, other highlights were Eurasian Wigeon, *Harlequin Duck*, Iceland Gull, Lesser-black Backed Gull, Little Gull, Short-eared Owl, *Audubon's Yellow-rumped Warbler*, *Brewer's Blackbird*, Henslow's Sparrow, and Yellow-headed Blackbird. A very early Indigo Bunting was reported from Geneva.

Observers: Fred Bertram, Jack Brubaker, Dick Clements, Carl David, Bill Evans, John Gregoire, Kevin Griffith, Chris Hymes, Steve Kelling, Kevin McGowan, Tom Nix, Bard Prentiss, Ken Rosenberg, Dave Russell, Robert Spahn, Laura Stenzler, Cayuga Bird Club, Chemung Valley Bird Club, Eaton Bird Club, Schuyler Co. Bird Club. Many reports were gleaned from the computer internet CAYUGABIRDS and NEWYORKBIRDS listserves as well as the Ithaca RBA.

Crow:** poor nesting year due to dry conditions (KM). **Fish Crow:** three CV 15 Mar; one KHMO 29 Mar; four TCMC. **Com. Raven:** two Mt Pleasant 19 Mar; one Hammond Hill 1 Apr; two Ithaca 29 Apr; three CV period; four SCMC. **Black-capped Chickadee:** 57 SCMC; 100 TCMC. **Tufted Titmouse:** 13 SCMC; 16 TCMC. **Red-breasted Nuthatch:** five SCMC; eight TCMC. **White-breasted Nuthatch:** four SCMC; 14 TCMC. **Brown Creeper:** 15 TCMC. **Carolina Wren:** several CV; three SCMC; one TCMC. **House Wren:** 23 SCMC; 25 TCMC. **Winter Wren:** arr Ithaca 1 Apr. **Golden-crowned Kinglet:** 12 SW 19 Apr; numerous through Region. **Ruby-crowned Kinglet:** abundant through Region Apr; 12 SSMC; 30 TCMC. **Blue-gray Gnatcatcher:** 20 SCMC; three TCMC. **Veery:** 10 SCMC; 20 TCMC. **Gray-cheeked Thrush:** arr SW 17 May. **Hermit Thrush:** arr CV 16 Apr; three SCMC; 12 TCMC. **Wood Thrush:** 34 SCMC; 59 TCMC. **Am. Robin:** 134 SCMC; 151 TCMC. **Gray Catbird:** arr Lansing 13 Apr; 40 SCMC; 40 TCMC; numbers down CV. **N. Mockingbird:** scattered through Region. **Brown Thrasher:** numbers declining CV; ten reports CLB, numbers increasing. **Am. Pipit:** 200 CV 18 Apr; last Lansing 8 Apr. **Cedar Waxwing:** 250 Ithaca 14 Apr. **N. Shrike:** last Schu 11 Mar. **European Starling:** 102 SCMC; 108 TCMC.

Yellow-throated Vireo: six SCMC; four TCMC. **Warbling Vireo:** arr MPt 23 Apr, record early; four SCMC; 21 TCMC. **Philadelphia Vireo:** one KHMO 17 May. **Red-eyed Vireo:** five SCMC; five TCMC. **Blue-winged Warbler:** arr CV 9 May; 16 SCMC; 16 TCMC. **Golden-winged Warbler:** arr CV 10 May; one Brooktondale 16 May; one Geneva 22 May. **Blue-winged X Golden-winged Warbler:** Brewster's type CV 13 May, Danby 20 May; Lawrence's type CV 13 May. **Tennessee Warbler:** scattered reports through May. **Nashville Warbler:** ten SCMC; ten

TCMC; one Dryden 30 May. **N. Parula**: arr Ithaca 10 May; one SCMC; one CV 16 May. **Yellow Warbler**: 150 SCMC; 92 TCMC. **Chestnut-sided Warbler**: 15 SCMC; 18 TCMC. **Magnolia Warbler**: five SCMC; nine TCMC. **Cape May Warbler**: one SCMC. **Black-throated Blue Warbler**: eight SCMC; 31 TCMC. **Yellow-rumped Warbler**: overwintered, numerous through early May; eight SCMC; 71 TCMC; *Audubon's* type Ithaca 3-5 May (SK, NYSARC). **Black-throated Green Warbler**: 26 SCMC; 48 TCMC. **Blackburnian Warbler**: five SCMC; 17 TCMC. **Pine Warbler**: overwintered Freeville through 17 Mar; three Ithaca after 17 Mar, early; one CV 22 Apr. **Prairie Warbler**: arr CV 6 May; four SCMC; five Caroline 23 May. **Palm Warbler**: arr Dryden L 15 Apr, record early; scattered reports until 9 May, all thought to be eastern Yellow subspecies. **Cerulean Warbler**: arr CV 13 May; three TCMC. **Black-and-white Warbler**: 21 SCMC; eight TCMC. **Am. Redstart**: 17 SCMC; 40 TCMC. **Prothonotary Warbler**: arr MNWR 13 May. **Worm-eating Warbler**: one CV 9 May. **Ovenbird**: 50 SCMC; 44 TCMC. **N. Waterthrush**: two SCMC; six TCMC. **Louisiana Waterthrush**: arr Enfield 13 Apr; three SCMC; four TCMC. **Mourning Warbler**: arr KHMO 13 May. **Com. Yellowthroat**: 162 SCMC; 81 TCMC. **Hooded Warbler**: arr SW 9 May; three Naples 22 May; scattered reports through Region. **Wilson's Warbler**: scattered singles. **Canada Warbler**: five Connecticut Hill 21 May; five SCMC. **Yellow-breasted Chat**: one Michigan Hollow 13 May (JC).

Scarlet Tanager: nine SCMC; eight TCMC. **N. Cardinal**: 31 SCMC; 44 TCMC. **Rose-breasted Grosbeak**: arr MNWR 22 Apr, record early; 30 SCMC; 43 TCMC. **Indigo Bunting**: arr Geneva 22 Mar (FB), record early; one Ulysses 23 Apr, very early. **Rufous-sided Towhee**: present CV entire period; 21 SCMC; 19 TCMC. **Am. Tree Sparrow**: last Dryden L 22 Apr. **Chipping Sparrow**: 63 SCMC; 90 TCMC. **Field Sparrow**: arr Caroline 16 Apr; 4 SCMC; 27 TCMC. **Vesper Sparrow**: only two reports. **Savannah Sparrow**: one SCMC, very scarce; 32 TCMC. **Grasshopper Sparrow**: arr Aurora 3 May; one SCMC; two TCMC. **Henslow's Sparrow**: arr Ellis Hollow 30 Apr; four Freeville 20 May. **Fox Sparrow**: arr CV 12 Mar; last Shindaigin Hollow 21 Apr. **Song Sparrow**: 89 SCMC; 82 TCMC. **Lincoln's Sparrow**: one SCMC 13 May. **Swamp Sparrow**: arr MNWR 8 Apr; 60 SCMC; 19 TCMC. **White-throated Sparrow**: 32 SCMC; 13 TCMC. **Dark-eyed Junco**: seven SCMC; 59 TCMC. **Lapland Longspur**: one CV 20 Mar. **Bobolink**: 101 SCMC; 89 TCMC. **Brewer's Blackbird**: female KHMO 2 May (JG, NYSARC). **E. Meadowlark**: arr CV 21 Mar; ten SCMC; 18 TCMC. **Yellow-headed Blackbird**: one KHMO 25 Mar (JG); one MNWR 29-30 Apr (mob). **Rusty Blackbird**: scattered, last CV 6

May. **Com. Grackle**: 54 SCMC; 66 TCMC. **Brown-headed Cowbird**: 22 SCMC; 63 TCMC. **Orchard Oriole**: one Sheldrake 25 May. **N. Oriole**: arr Aurora 3 May; 31 SCMC; 39 TCMC. **Purple Finch**: 16 SCMC; eight TCMC. **Pine Siskin**: one KHMO 3 May, only report. **Am. Goldfinch**: 265 SCMC; 153 TCMC. **Evening Grosbeak**: one Caroline 16 Mar-4 Apr; small flock CV through mid-May.

732 Old 76 Road, Berkshire, New York 13736

REGION 4 — SUSQUEHANNA

MARY DOBINSKY

Birders had few complaints about 1995's spring weather. Following a mild winter with minimum snow, March entered, stayed and left like the proverbial lamb. According to Harold Hollis, U.S. National Weather Service observer at Cooperstown, the month was 3.5°F warmer and 1.38 inches dryer than normal. Not so April, which was 3.0° colder than average. Binghamton posted a record low temperature reading of 14°F on 5 Apr after overnight snow squalls. Another storm on 8 Apr dropped four inches of slushy snow on the city. Precipitation for the month, however, was only a half inch over average. Clouds prevailed at least part of many days in May, but 5 May was the only rainy day and 29 May had the only damaging storm. Temperatures for the month were a hair below average. However, May rainfall was down 1.47 inches from normal. It all added up to a three month precipitation deficit of 3.37 inches at Cooperstown. "We just missed listing in the top ten driest springs of the century," said Hollis.

Negative effects of the aridity may appear in the summer report, but for spring migration, the weather was perfect. Rivers and streams were mostly open from the beginning of the season. Runoff was light and flooding was minimal. Lakes and ponds opened early. With such excellent conditions for water birds, it is not surprising that we had high counts, record early arrivals for Green Heron and American Bittern, and late departures for Redhead and Surf Scoter. Record numbers of Snow Goose were reported as well as the first Brant in 11 years. The 22 species of duck ties our best record and includes above average numbers of

Redhead and Lesser Scaup. Few migrating raptors were seen, but several Rough-legged Hawk remained until mid April. Cooper's Hawk, Red-shouldered Hawk and Northern Goshawk were among the species reported nesting. Excellent numbers of Common Moorhen and American Coot were a surprise, as was the total of nine shorebird species.

Passerine migration continued the excitement as some very early arrivals introduced a long, leisurely season. Yellow Warbler arrived a month ahead of normal. In all, 14 species of warblers were found in the Region during April. For other families, notable early arrivals included Eastern Kingbird, Blue-gray Gnatcatcher, Solitary Vireo and Rose-breasted Grosbeak. We hit a lull in early May. Storms in the south may have stalled migration. But by 12 May, the latecomers began appearing in force. This set up spectacular conditions for BROO, OTSE and TIOG North American Migration Counts the next day. Some of the high maxima in the species accounts may be attributed to this explosion of new arrivals. Marie Petuh, at Greenwood Park for the BROO count, noted, "Blue-gray Gnatcatchers were everywhere. They must have just arrived." Multiple Northern Parula were found; one a season has been good in recent years. The Delaware-Otsego Audubon Society ran their 27th annual May Big Day Count a week later and achieved a new record of 136 species. This mass effort is also reflected in the species accounts. Migration excitement persisted to the end of the period, concluding with a rare *Kentucky Warbler*. Other spring rarities were two Regional firsts, *Clay-colored Sparrow* and *LeConte's Sparrow*, plus Sedge Wren, White-eyed Vireo and Orange-crowned Sparrow. Also rare, at least in recent years, were Great Egret, Snowy Egret, Common Tern, Black Tern and Yellow-breasted Chat. Missed species included Red-necked Grebe, Upland Sandpiper, Yellow-bellied Flycatcher, Gray-cheeked Thrush, Philadelphia Vireo, Snow Bunting, Pine Grosbeak, both crossbills, and Com. Redpoll. All expected species of grassland sparrows were scarce but reported. Our record spring total of 204 species tied last year's tally.

four DELA 7 Apr (AM); max 17 Crum L 23 Apr (IW), one still there 7 May, missed some years. **Oldsquaw**: ten OnRes 4 Apr (CV), only report. **Surf Scoter**: Susquehanna R Portlandville DOASMBDC, only report, record late. **Com. Goldeneye**: one BROO, several TIOG Mar, scarce. **Bufflehead**: max 20 BROO 17 Apr 16 reports to 4 May. **Hooded Merganser**: arr two BROO 3 Mar; max 20 each three BROO sites 19 Mar; female HCPLC 19 May, probable nester. **Com. Merganser**: max 150 BROO 17 Mar (HM, BB, GK). **Ruddy Duck**: OnRes 4 Apr (CV), first spring since 1982.

Turkey Vulture: arr 1 Mar, record early; many reports, max 12. **Osprey**: max six at three BROO sites 30 Apr (MP); last six on two NAMCs, early departure. **Bald Eagle**: max ten Delaware R Hancock 3 Mar (BG); singles TIOG 10 Mar, BROO 18 Mar. **N. Harrier**: max five TIOG NAMC. **Sharp-shinned Hawk**: twenty widespread reports, max two. **Cooper's Hawk**: "pair all year and nesting" Greene (BB); pair in display flight Endicott March (JS). **N. Goshawk**: singles T Preston 4 Mar, 5-6 Apr (EH); CVSP 15 Mar (JH); pair Crum L May, probably nesting. **Red-shouldered Hawk**: arr Johnson City 4 Mar; pair with three y TIOG (JB), same nest as last year. **Broad-winged Hawk**: arr Norwich and Johnson City 16 Apr. **Am. Kestrel**: max 14 on three NAMCs. **Ring-necked Pheasant**: five March, four Apr reports, max two, good count. **Ruffed Grouse**: max 11 TIOG NAMC. **Wild Turkey**: max 137 W Burlington 2 Mar; many sizable flocks to late Apr. **N. Bobwhite**: Long Pd 15 May. **Virginia Rail**: UL 19 May (JSh), only one. **Com. Moorhen**: max four BoPd 13 May (JH, MP); singles UL 19 May (JSh); Andrews Reserve Bainbridge 21 May (DW); TIOG NAMC, excellent count. **Am. Coot**: OtsL docks to 17 Mar, max 46 (CV, TS); UL 19 Mar-8 Apr (JH, T&NT, MP), first spring since 1991. **Semipalmated Plover**: North Norwich marsh 15 May (EH), first spring since 1987. **Killdeer**: max 49 on three NAMC's. **Greater Yellowlegs**: max five TIOG 19 Apr (C&JB); five May reports to 23 May. **Lesser Yellowlegs**: five reports max two 23 Apr to 26 May, second spring since 1985. **Solitary Sandpiper**: arr CHEN 27 Apr; max eight on two NAMCs. **Spotted Sandpiper**: max 30 Chenango R from Sherburne south 18 May (TS). **Least Sandpiper**: Binghamton 19 May; three Portlandville 23 May, only reports. **Com. Snipe**: four sites, max two, scarce. **Am. Woodcock**: female, three y crossing road Long Pd 26 May (HM). **Bonaparte's Gull**: DP 19 May; DOASMBDC, only reports. **Ring-billed Gull**: max 48 BROO 11 Mar. **Herring Gull**: max six BROO 13 Mar. **Com. Tern**: DP 19 May (JSh), first since 1984. **Black Tern**: singles DP and Murphy's Sand 19 May (JSh), first since 1986.

Black-billed Cuckoo: nine sites after 16 May. **Yellow-billed Cuckoo:** singles BROO 22 May; TIOG 23 May, only reports. **E. Screech-Owl:** singles two BROO sites May. **Great Horned Owl:** max three TIOG NAMC. **Barred Owl:** Triangle and T Preston Mar, Apr; five sightings May, good count. **Long-eared Owl:** found injured BROO, being rehabilitated. **Com. Nighthawk:** singles five sites, scarce. **Chimney Swift:** max 15 on three NAMCs. **Red-headed Woodpecker:** singles Oneonta feeder 19, 20 May (MD), Cush Hill CHEN 20 May, TIOG NAMC, best count since 1985. **Red-bellied Woodpecker:** two BROO reports Mar; four TIOG Apr, May; one CHEN May, good count. **Yellow-bellied Sapsucker:** max 36 on OTSE, TIOG NAMC. **Pileated Woodpecker:** max eight TIOG NAMC, reports increasing.

Olive-sided Flycatcher: singles Adams Farm CHEN 20 May (EH); Crumhorn Mt 28 May, often missed. **E. Wood-Pewee:** 12 reports after 13 May, max three. **Acadian Flycatcher:** one TIOG NAMC, often missed. **Alder Flycatcher:** seven reports after 15 May, max five. **Least Flycatcher:** max 42 on two NAMCs. **Great Crested Flycatcher:** max five OPM 20 May. **Horned Lark:** two OTSE reports Mar, max ten; one Binghamton Airport 19 May, scarce. **Purple Martin:** max 70 Delhi Bird Club 20 May; only three others. **Tree Swallow:** very early arr on nesting site Greene 27 Feb, joined by female more than a month later, and nested (BB). **N. Rough-winged Swallow:** 14 reports, max five CHEN 20 May. **Bank Swallow:** max 97 DOASNAMC. **Cliff Swallow:** max 46 DOAS NAMC. **Barn Swallow:** max 201 on two NAMCs. **Fish Crow:** max six CVSP 13 Mar (HM, BB, GK); two other BROO sites, two TIOG, one CHEN, high count. **Sedge Wren:** UL on 19 May (JSh), last sighting predates 1979, perhaps record early. **Carolina Wren:** eight sites, slow recovery. **Marsh Wren:** arr DOT marsh Vestal 19 May (JSh); one Greene 30 May (BB), often missed. **E. Bluebird:** max 14 each DOAS, TIOG NAMC. **Swainson's Thrush:** two DOASMBDC, only report. **Wood Thrush:** max 74 on two NAMCs. **N. Mockingbird:** max six TIOG NAMC. **Brown Thrasher:** max six TIOG NAMC, continues scarce. **Am. Pipit:** WPt 8 Apr (AL), only report.

White-eyed Vireo: Nuthatch Hollow Vestal 7, 8 May (PB, MP, ES), first spring report since 1980. **Solitary Vireo:** max 14 DOASNAMC. **Yellow-throated Vireo:** ten reports after 4 May, max two. **Blue-winged Warbler:** max 20 TIOG NAMC. **Golden-winged Warbler:** three sites BROO May, two TIOG, high count. **Tennessee Warbler:** two BROO sites, one OTSE, max two, scarce and late arr. **Orange-crowned Warbler:** DOASMBDC, third spring report since 1985. **Nashville Warbler:** max 20 on two NAMCs; six Crumhorn Mt 12 May, high counts. **N. Parula:** four reports 10 birds, max six BoPd (MP JH), best since 1982. **Yellow Warbler:**

two Binghamton area 26 Mar, three others found before 25 Apr, former record early arr. **Chestnut-sided Warbler**: max 56 on three NAMCs. **Magnolia Warbler**: only 11 reports, mostly singles, scarce. **Cape May Warbler**: singles TIOG NAMC and DOASMBDC, scarce. **Black-throated Blue Warbler**: max 39 on two NAMCs. **Yellow-rumped Warbler**: max 116 on three NAMCs. **Black-throated Green Warbler**: max 50 on three NAMCs. **Blackburnian Warbler**: eleven reports after 12 May, max three, good count. **Pine Warbler**: at CHEN feeder 22-26 Apr (EH); singles two BROO sites, good count. **Prairie Warbler**: eight reports after 28 Apr, max five on NAMCs. **Palm Warbler**: only one CHEN 5 May (EH). **Bay-breasted Warbler**: six reports, max two, best since 1988. **Blackpoll Warbler**: seven reports, max three, good numbers. **Cerulean Warbler**: Johnson City 15-31 May (JH), often missed. **Am. Redstart**: max 37 on NAMCs. **N. Waterthrush**: max seven DOASNAMC. **Louisiana Waterthrush**: max five each DOAS, BROO NAMCs. **Kentucky Warbler**: T Preston 29, 30 May (EH), second successive spring but only third in 13 years. **Hooded Warbler**: only one TIOG NAMC. **Wilson's Warbler**: three reports, max three 13-20 May, best since 1986. **Canada Warbler**: max nine on three NAMCs. **Yellow-breasted Chat**: Johnson City 13, 14 May (MP), same area as last fall, first spring reports since 1983.

Scarlet Tanager: max 24 TIOG NAMC, later arr n sector of Region. **Rose-breasted Grosbeak**: max 80 on three NAMCs. **Indigo Bunting**: good numbers after 11 May, four at niger seed feeders. **Rufous-sided Towhee**: max 43 TIOG NAMC. **Clay-colored Sparrow**: at feeder T Preston 15, 16 Apr (EH, DW), first Regional spring report. **Vesper Sparrow**: two singles OTSE, one CHEN, scarce. **Grasshopper Sparrow**: singles TIOG NAMC, DOAS MBDC. **Henslow's Sparrow**: only one Long Pd Forest 26 May, "area managed by DEC for grassland species" (MP). **LeConte's Sparrow**: "singing on a weed stalk back of our barn in alfalfa field" Owego 7 May (JB, NYSARC). **Fox Sparrow**: 18 sites 17 Mar-12 May, max eight, high count. **Lincoln's Sparrow**: only one Johnson City 8 May (JH). **White-crowned Sparrow**: max 35 TIOG NAMC; nine other reports 1-13 May. **E. Meadowlark**: max 36 on NAMCs. **Rusty Blackbird**: max 42 two Broo sites 28 Mar (ES); 14 W Corners Marsh 5 Apr (WW); three singles May, record high count. **Purple Finch**: max 67 on NAMCs. **Pine Siskin**: only one HCPLC 29 Apr (JSm). **Am. Goldfinch** max 340 on NAMCs, high feeder counts through Apr. **Evening Grosbeak**: only two DOASMBDC.

7 Spencer Drive, Oneonta, New York, 13820

REGION 5 — ONEIDA LAKE BASIN

DOROTHY W. CRUMB AND JAMES THROCKMORTON

Too much or too little. Central New York weather can never decide which to burden us with. The winter brought very little snow and there were no late spring storms. The average maximum temperature was 48.1°F and the average minimum was 26.7°F. The average temperature in March of 37.4°F was 3.5° below normal. The minus 1° tied the record as the lowest temperature ever on 10 Mar. The total precipitation was 1.31 inches, less than half normal. Moreover, snow total was only 6.9 inches, 10.6 inches below normal. This combination tied the record for the sixth driest March. April followed suit with only 1.88 inches of precipitation, which is 1.45 inches below normal. This made it the tenth driest April on record. It was also the eleventh coldest. Temperatures averaged 42.4°F, 3.3° below normal. The highest temperature for the month was 75°F on 27 Apr. It didn't warm up much in May with the 56.9°F average still 0.2° below normal. The highest temperature for the month was 82°F. A total of 1.31 inches of precipitation was again less than half normal. Below normal precipitation of 4.5 inches for the three months produced a poor collection of ground water. The combination of lack of water and cooler weather slowed vegetation down somewhat. But, as usual, there were leaves on the trees to obscure the warblers from view when migration began.

Unusual waterfowl or wading birds created quite a splash this spring. An Eared Grebe was the first since 1986 and is the first Regional spring record. Two Glossy Ibis and a Little Blue Heron flew past Derby Hill. Two Great Egret were seen many times in a large Great Blue Heron colony after mid May, sometimes in a nest and sometimes just feeding at the base of the flooded trees. Greater White-fronted Goose, Eurasian Wigeon, and Barrow's Goldeneye were unexpected waterfowl.

It is amazing to look back in the old records and see maxima of one to ten Double-crested Cormorant in the 1960s, ten to twenty in the 1970s, up to a thousand in the 1980s. Now, half way through the 1990s, the daily maximum already is in the thousands.

Although there were long, dull stretches of north winds at Derby Hill during the entire season, the few days of south winds helped to make up for many boring days of searching the skies. Ten of the 14 species

normally seen at Derby Hill came through in record numbers. This included Turkey Vulture, both eagles and Merlin. The Bald Eagle total is up 32 from last year. The Golden Eagle totals included 28 adults. Good weather during March and consistent flights on off-wind days both contributed to a record totals for Northern Harrier, Cooper's Hawk, Red-shouldered and Rough-legged Hawks. But to quote Brian Sullivan, the Derby Hill observer, "1995 will be remembered as the year of the Red-tailed Hawk." Huge flights of this species through the entire season added up to a record shattering total of 19,531. This season total is the highest anywhere in the world. Stranger still, is the fact that such a huge flight occurred in the spring, when the bulk of the birds are adults. The peak flight was 4,591 on 11 April, an astonishing record. These numbers are well above average, reflecting the excellent weather in early March as well as this species' solid foothold in the Northeast. A large number of western Red-tailed Hawks was observed, including 10 dark morphs, 2 rufous morphs and 5 Krider's Red-tailed. One *Swainson's Hawk* added to the total of western species identified. Merlin set a record late date for the species, after the official count ended.

Five each of *Sandhill Crane* and Short-eared Owl were unusual at Derby Hill. The two observers at Derby Hill attempted to estimate the magnitude of some of the passerine flights for the month of March. The peak days were 19 and 20 March with over one million birds. Totals for Red-winged Blackbird, Common Grackle, Brown-headed Cowbird, Starling and American Robin appear below. The estimate of Red-winged Blackbird for the month was 1,650,150, and American Crow totaled 70,679 for the month. Needless to say, this census is a difficult task when you are trying to count, age and sex the raptors that are also flying overhead.

Cooper's Hawk seem to be moving closer to habitation (or is it the other way around?) A pair moved into an evergreen grove in a Pompey back yard to lay five eggs in a newly constructed nest. A pair of Cooper's Hawk also nested in a more secluded, but new location at Sandy Pond OSWE. There were two unusual sightings of Merlin, including one in the Adirondacks at the end of May. Nesting of Merlin in the Adirondacks has already been documented and we hope this bird foretells nesting in this Region.

There were the normal few shorebirds on the normal dates. However, as is also usual in the spring, there had to be a few exceptions.

Sanderling, seldom seen here in the spring, appeared three weeks earlier than the earliest prior date. White-rumped Sandpiper and a small flock of Whimbrel, only the third spring record since 1970, were also unusual spring sightings. However, the previous report of Whimbrel in May 1992 was also of a small flock.

There were only two reports of Eastern Screech-Owl. This species may be having serious recovery problems from the severe winter of 1993-94. Red-headed Woodpecker, few as they are, returned to their normal locations plus a new location in Jamesville. Acadian Flycatcher was seen in two new places this spring. Many thrushes were heard flying overhead at night during migration, but sightings of birds on the ground were rather few. Three Fish Crow were found at a shopping center on the north side of the city of Syracuse. There was some obvious courtship activity and there is good nesting habitat in a nearby cemetery. They were also heard two different times at Schiller Park, which is only a mile from the shopping center as the crow flies. Fish Crow has not been seen regularly in Region 5 since 1990. A White-eyed Vireo was the first spring sighting since 1991, and Philadelphia Vireo set a Regional record max. Northern Parula was more numerous than usual. A Prairie Warbler returned to its nesting site north of Parish after a year's absence. Cerulean Warbler seems to be on the increase. Warbler rarities found this spring were Connecticut, the first spring sighting since 1986, and Kentucky. A *Blue Grosbeak* with many Indigo Bunting may be the first verified sighting in Region 5. A Dickcissel appeared very briefly at a feeder in April. Henslow's Sparrow returned to a nesting location at West Monroe and stayed through the period for the first report in Region 5 since 1991. Lincoln's Sparrow was observed more than usual in migration, and White-crowned Sparrow produced the second highest spring count for the Region.

There were many rarities or overshoots for the season. The large numbers of hawks of various species is certainly encouraging. The possibility of first Regional nesting by Merlin, Great Egret, and Fish Crow were also hopeful pluses. *Blue Grosbeak* was probably the most unusual bird of the season. On the down side is the slow recovery from our severe winters of Eastern Screech-Owl and Carolina Wren, and grassland species continue to be scarce.

Our thanks to Craig Fosdick, who has been a great help for the four years that he was at Oswego College. We wish him luck and good birding in the future.

REGION 6 — ST. LAWRENCE

LEE B. CHAMBERLAINE

The spring of 1995 was not normal by any means. With the winter of 1994-95 being the second warmest in 100 years in the US and the twentieth mildest in New York in 100 years, what else would one expect? However, an early and warm spring was not to be. March was sunny but cold, many days with north winds in the 10 to 15 mph range. Snowfall was minimal for March. The highest temperature was 60°F at 3 AM on 9 Mar, followed by freezing rain and snow. April was characterized by lots of NW, N, or NE winds, with highs in the 50s during the days and night time lows below freezing. There were almost no April showers and heavy frost occurred into early May. The April showers came in May. The warmest weather started on 29 May when it hit 80°F in Ogdensburg. Rainfall for the period was about two inches below normal and boaters were experiencing problems on Lake Ontario and the St. Lawrence River before the end of the period due to low water. With Lake Ontario water remaining cold, northerly winds, and the lack of any southerly wind flow, the vegetation was farther behind than even last year. Some trees were still not in full leaf at the end of the period and many flowers were considerably behind schedule.

The weather delayed many species of birds but we did set new record early dates for Caspian Tern, Swainson's Thrush, Rose-breasted Grosbeak and Northern Oriole. Waterfowl put on some pretty impressive numbers, with two Eurasian Wigeon and the first Regional *Tufted Duck*. Raptors were scarce, as expected from the winter period. Dean DiTomasso found a displaying *Spruce Grouse* at the Massawepie Mire in the Town of Piercefield in StLA. Woodpeckers were impressive. Black-backed Woodpecker was found in the Adirondacks as well as the boreal flycatchers, Gray Jay, and Boreal Chickadee. Swallow numbers generally were low. Blue-Gray Gnatcatcher was again present in impressive numbers. Bluebird counts are still improving and Northern Mockingbird reports just about covered the Region. Warblers and vireos were fantastic as to variety and numbers with Leone, Hughes, and Emery working the migrant trap at Snowshoe Road, Stony Point, and DiTomasso finding nesting birds at Adirondack locations in StLA. Leone located two new breeding locations for Prairie Warblers on Fort Drum and an alvar grassland-limestone woodland area in the Town of Clayton in JEFF. He also found high numbers of Grasshopper and Henslow's Sparrows by surveying possible habitats and known habitats late at

night and early in the morning. Winter finches were very disappointing but better than the winter period at many locations. Crossbills and Pine Siskin appeared at several Adirondack locations.

Negatives for the period included low numbers of loons, raptors, Common Moorhen, owls, flycatchers, swallows, and some sparrow species.

REGION 7 — ADIRONDACK-CHAMPLAIN

JOHN M. C. PETERSON

After the relatively mild winter, March appeared to promise an early spring, with temperatures about 50°F on 13 Mar and about 60°F the next day. But the month closed with snow at Paradox on 30 Mar, and early April was cold. A cold front on 4 Apr caused thermometers at Saranac Lake to drop from 40°F to 25°F in just four hours. The next two days it was 13°F at Elizabethtown, warming only to the 30°s on 7 Apr. A clear, cool stretch continued to the end of the month, although Plattsburgh reached 54°F on 13 Apr and 52°F on 17 Apr, and the mercury finally touched the 70°s briefly on 19 Apr. A warming trend began in May, with Plattsburgh at 62°F on 1 May and 70°F on 9 May. The last frost at Inlet was on 20 May. It remained an extremely dry spring, although a storm the evening of 28 May managed to blow out the wall of a tent at the Crown Point banding station. Observers agreed that this seemed to be a wonderful spring for birds, yet only 192 species were reported, down from 205 last year and 216 in 1993.

In spite of the weather setback in April, there were a number of early arrivals, and nesting began early for a wide range of species. Waterfowl especially seemed to hatch young at a record pace. Early nesting Canada Goose had hatched young by mid May, when they could be seen while skeins were still migrating north. An American Black Duck was also early, and most remarkable was a hen Common Goldeneye that set an early New York State nesting record.

A pair of Osprey at Webb Royce Swamp built the first non-platform nest in the Champlain Valley. The New York State DEC reported Bald Eagle and Peregrine Falcon on eggs during May. A pair of Merlin was reported at a new site in early May, where a displaying Spruce Grouse was seen at the month's end. A pair of Wilson's Phalarope returned to the Chazy Rivers breeding grounds. Winter Wren was nest building a month ahead of the prior New York State early date, and Blue-gray Gnatcatcher wasted no time nesting either. American Robin built two *ground nests* at Ticonderoga, and (Yellow) Palm Warbler was again on territory at Spring Pond Bog.

Meanwhile, the bumper cone crop continued to attract breeding winter finches into spring. Purple Finch banded near Elizabethtown 10 May had developed brood patches and cloacal protuberances. Red Crossbill was widespread, with reports from Bloomingdale Bog, Copperas Pond, Ferd's Bog, Macomb, and Sabattis Road Bog. Bob Yunick spent two days in March salvaging roadkills in Hami. The specimens were an interesting mix, mostly of the small race *Loxia curvirostra minor* but several in the size range of *L. c. neogaea*. White-winged Crossbill was similarly abundant, and Yunick found a dead juvenile male in late March. Pine Siskin banded Elizabethtown in April and May included birds in breeding condition.

The bird-banding station at Crown Point State Historic Site was in operation for 18 days, from 12-29 May. During this 20th anniversary season, a total of 740 birds of 57 different species were banded and released, with Yellow-bellied Flycatcher and House Finch new to the station. Flycatcher and thrush banding was especially good this spring. The height of warbler migration was 25 May, when ten species were banded. There were returns of 35 individuals of 16 species banded at Crown Point in previous years. The oldest returns were a Great Crested Flycatcher and Yellow Warbler, both aged at least six years, 11 months. A female Red-winged Blackbird banded at Crown Point 14 May 1993 was found dead near Summerville, SC, 23 Feb 1995 when she was at least three years, eight months old.

There were a number of interesting migrants and visitants. A *Ross's Goose* was found among Snow Goose in early April. A *Gyr Falcon* barely persisted into March. *Connecticut Warbler* and *Yellow-throated Warbler* were unexpected visitors to the Region.

Rock Dove: AU banded racing pigeon released on 1-mile training flight North Bay ONEI 14 Mar (NL) killed and eaten by hawks Paradox ESSE the same day (LG-K)! **Black-billed Cuckoo**: pair CPtP 17-29 May (JP). **Short-eared Owl**: max eight ChR 3 Mar, where present 8 Feb-8 Apr. **N. Saw-whet Owl**: West Mt Trail 6 May; Inlet 12 May, only reports. **Com. Nighthawk**: Elizabethtown 4 May (MG); AFR 22 May DSt); 6-8 Bulwagga Bay 26 May (DN, JP); ESSE 25 May (J&PT), a good showing. **Whip-poor-will**: AFR 22 May (DSt); Peru 25 May (J&CH); CPtP 27 May (DN), also encouraging. **Chimney Swift**: max cloud of 225 wheeling over edge of TL village and marsh 8:15 PM 13 May (C&MD); FRAN and Regional record is 500, but this count impressive. **Three-toed Woodpecker**: sharing same tree with Black-backed Woodpecker FB 22 Mar (SK). **Black-backed Woodpecker**: max 3-4 FB 30 Apr; L Placid, Lower Sargent's Pd, and on nest Raquette L; pair at a nest hole Chubb R Swamp 28 Apr.

Yellow-bellied Flycatcher: banded CPtP 24 May (JP). **Willow Flycatcher**: arr APt 29 May (LS). **"Traill's" Flycatcher**: 14 banded CPtP. **Least Flycatcher**: 16 banded CPtP. **Great Crested Flycatcher**: five banded CPtP. **E. Kingbird**: three banded CPtP. **Horned Lark**: six TL 18 Apr, only report. **Gray Jay**: Saranac Inn feeder 14-15 Mar; other reports from Bloomingdale Bog, Cedar L, FB, Helldiver Pd, Sabattis Road Bog, and Spring Pd Bog. **Com. Raven**: three at cottontail rabbit roadkill provided at Elizabethtown feeder 19 Mar (JP); nest in a hole in the chimney of a Raquette Lake camp fledged three young. **Boreal**

Chickadee: reports from Cedar L, FB, and summit of Phelps Mt. **Tufted Titmouse:** Elizabethtown 17 Apr; APt 7 May. **Brown Creeper:** singing Bloomingdale Bog by 18 Mar. **Winter Wren:** nest building at Lower Sargent's Pd 23 Apr, earliest egg date is 22 May. **Carolina Wren:** Saranac L 20 May (RH), only report. **Ruby-crowned Kinglet:** overwintered Clinton Comm. College, singing there 3 Apr (DSt). **Blue-gray Gnatcatcher:** arr Clinton Comm. College 29 Apr (DSt); WRS 1 May, Bulwagga Bay 9 May; pair finishing a nest CPtP 12 May, banded there 29 May; Ticonderoga 13 May; strong showing. **Veery:** early arr Split Rock 25 Apr (MG). **Swainson's Thrush:** heard vocalizing Keene 15 Apr (RM), compared to "Wild Sounds of the Northwoods" cassette; seven banded CPtP, high total. **Wood Thrush:** 17 banded CPtP, high total. **Am. Robin:** dozen feeding on insect hatch on ice of St. Regis R. 7 Mar (HW); 32 banded CPtP, high total; two ground nests "snuggled into the lawn" and "under the picnic table" Ticonderoga during April and May, third nest "on an old table, next to the cellar door which is under our deck" (JC). **Gray Catbird:** 66 banded CPtP. **N. Mockingbird:** arr Inlet 1 May (GL), where unexpected; CPtP 16 May less surprising. **Am. Pipit:** max 55 TL 13 May (CD), more than usual. **Cedar Waxwing:** record 77 banded CPtP, one with orange tail tip banded there 18 May.

Yellow-throated Vireo: arr AFR 19 May (DSt); Carpenter Flats 29 May (LS). **Philadelphia Vireo:** arr AFR 20 May DSt). **N. Parula:** two-three singing males Silver L Bog CLIN 25 May (BK, CM). **Yellow Warbler:** 44 banded CPtP ties previous record. **Yellow-throated Warbler:** one CPtP in hawthorn close to gnatcatcher nest near Bulwagga Bay 14 May (GL), first ever here. **Prairie Warbler:** banded CPtP 14 May (JP); AFR 20 May (DSt), rare here. **Palm Warbler:** migrant CLIN 5 May; on territory Spring Pond Bog in the Boreal Heritage Preserve 23 May (DS). **Bay-breasted Warbler:** arr CPtP 15 May (JP, DS). **Blackpoll Warbler:** arr CPtP 21 May (J&SP); record 25 banded there 21-27 May. **Mourning Warbler:** three banded CPtP 22-25 May. **Connecticut Warbler** one Wadhams 18 May (DS). **Wilson's Warbler:** arr Wadhams 18 May (DS); five banded CPtP 21-28 May.

N. Cardinal: four banded CPtP, including FL 25 May. **Indigo Bunting:** TL feeder 7 May. **Rufous-sided Towhee:** Inlet feeder 28 Apr (GL); two pair Mt Defiance 18 May (MG); AFR 19 May (DSt); summit Rattlesnake Mt. 27 May (LS), an excellent showing here. **Field Sparrow:** arr Elizabethtown 14 Apr. **Grasshopper Sparrow:** Plattsburgh AFB 8 May (BK), future plans for base are still uncertain. **Lapland Longspur:** last two Reynolds Road CLIN 10 Mar (BK). **E. Meadowlark:** arr ChR 18 Mar (JP). **Rusty Blackbird:** three migrants APt 25 Apr (BK); on territory

Chubb R Swamp 29 Apr (L&PO). **N. Oriole**: 16 banded CPTP, where ad male attacked ad Red-tailed Hawk in flight 28 May. **House Finch**: Inlet 17 Mar (GL), where scarce; *Mycoplasma gallisepticum* conjunctivitis first documented in this Region in bird banded and photographed at Elizabethtown 29 Apr (JP), although a television report suggests it may have appeared earlier in Plattsburgh (JH). **Red Crossbill**: male roadkill with cloacal protuberance, female with brood patch along Routes 8, 10, 28N, and 30 HAM 4 Mar, max 47 (41 plus six roadkills) there 26 Mar (RY), two size classes present; pair copulating FB 22 Mar (SK); last two s Tupper L 13 May. **White-winged Crossbill**: sightings at Bloomingdale Bog, Forestdale Road CLIN, Hurricane Mt., Lower Sargent's Pd, Sabattis Road, Split Rock Mt.; last at Chubb R Swamp 29 Apr; roadkilled juv (hatchling) male just beginning first prebasic molt along Route 10 T Arietta HAM 26 Mar (RY). **Com. Redpoll**: one Standish 4 Mar (HK, BK), unexpected, only report of the winter. **Pine Siskin**: 31 banded near Elizabethtown 16 Apr-10 May; max 30 Marcy Dam 20 May (DR). **Am. Goldfinch**: one with right eye diseased banded Elizabethtown 22 Apr (JP); 584 banded Elizabethtown 16 Apr-11 May; 142 banded CPTP 12-28 May. **Evening Grosbeak**: paired at Elizabethtown feeder by 19 Apr; max 30 TL 13 May; two summit Phelps Mt. 20 May (DR), a high elevation at 4,161 ft.

Exotics: **Mute Swan**: last seen APt 9 Mar (BK). **European Goldfinch**: CuH feeder 19 May (RE, BK).

Addendum: **Sharp-shinned Hawk**: second-year female banded near Elizabethtown 8 May 1992 was found dead at Copeland, FL, 16 Dec 1994, aged three years, six months.

Discovery Farm, RR 1, Box 230, Elizabethtown, New York 12932

REGION 8 — HUDSON MOHAWK

JANE E. GRAVES

The mild weather experienced since early winter continued during March. As reported from the Albany County Airport, the mean temperature was 40°F, 5.7° warmer than average, with 53% sunshine. The 2.20 inches of precipitation was 0.73 inches below normal, with only 4.6 inches of snow, far less than the norm of 10.7 inches. By contrast, April was generally cool, averaging 43.9°F, 2.5° below average, with the temperature going above 70° only on 27 Apr. Sunshine averaged 59%, 6% greater than normal. Rainfall was again sparse, with 1.94 inches being 1.05 inches below normal. May averaged 56.9°F, 0.9 degrees cooler than normal, with 54% possible sunshine. Rainfall was 2.06 inches below the norm of 3.41 inches. May was the ninth consecutive month with below normal precipitation.

Migration this spring was notable mainly for the large number of early arrivals. American Bittern, Virginia Rail, Common Moorhen, Lesser Yellowlegs, Pectoral Sandpiper, American Woodcock, Chimney Swift, Tree, Rough-winged and Bank Swallows, Hermit Thrush, Gray Catbird, Red-eyed Vireo, and Pine and Palm Warblers were at least one to two weeks earlier than usual. Paul Connor noted a big warbler wave in his front yard on 13 May, with nine species observed, including an Orange-crowned Warbler, both heard and seen well. 17 May brought another wave of migrants, with Black-billed Cuckoo, E. Wood-Pewee, Veery, and Scarlet Tanager being widely reported.

Regional observers reported a healthy total of 221 species. Included were 14 diurnal and six nocturnal raptor species, 14 shorebird species, and 29 warbler species. There were many sightings of both species of cuckoos and Blackpoll Warbler.

The most notable rarity of the season was *King Eider*. Other rarities sighted during the period included *Cattle Egret*, *Loggerhead Shrike*, and *Orange-crowned Warbler*.

REGION 9 — HUDSON-DELAWARE

MICHAEL L. USAI

The above normal temperatures and below normal precipitation from the winter persisted during March. The farther south in the Region, the less was the precipitation; in lower WEST precipitation was three inches lower than normal. However in ULST precipitation was normal or close to it. The Region received no snowfall during the March. Temperatures ranged from 3-4°F above normal throughout the Region. The lack of precipitation throughout the Region intensified in April. Most of the southern parts of the Region experienced mild drought conditions, but parts of SULL received near normal rainfall. Temperatures in April were slightly below normal. The beginning of the month was more like winter than spring, with two very strong cold fronts plowing through the area. Temperatures moderated towards the end of the month but still remained cool. May began with colder than normal temperatures and with over a week of relentless northwest winds. The middle and end of the month, however, brought warmer than normal temperatures balancing the cool temperatures in the beginning of the month bringing the average temperature to within 1° of normal.

The cool temperatures in the early spring delayed the migration by about a week. During April and the first week of May, migrants trickled through. A week of northwest winds in early May finally broke during the night of 11 May with a warm front and a day of rain. This brought a fantastic fallout of migrants throughout the entire Region. Reports of over 23 species of warblers were not uncommon. From then on southern winds transformed what started out as a lackluster migration to a very exciting spring migration.

Many unusual species were reported. Notable waterfowl reports include the first Regional breeding record of Northern Shoveler, and sightings of Greater White-fronted Goose, Eurasian Wigeon and Black Scoter. The Region's first and second *Common Black-headed Gull* outdid an unexpected Glaucous Gull. Both Caspian and Black Terns were found in the Region. A *Mississippi Kite* was reported. The bumper crop of tent caterpillars has resulted in good numbers of both cuckoo species being reported throughout the Region. A Barn Owl was an excellent find. An overwintering *Boreal Chickadee* barely persisted into April. Doodletown Road ROCK had a banner year. Hooded and Cerulean Warblers arrived there on 28 Apr, a week behind last year, but their numbers exceeded those of last year. A Kentucky Warbler and up to two

Golden-winged Warbler spent the month of May in the area of the reservoir. One of the Golden-winged Warbler was observed fighting with a "Brewster's" Warbler. The best of many warbler reports elsewhere were Orange-crowned Warbler, Prothonotary Warbler, *Yellow-throated Warbler*, and the rarest warbler was a *Connecticut Warbler*. However, neither Purple Finch nor Evening Grosbeak was reported.

Other highlights included Red-necked Grebe, Northern Gannet, Least Bittern, *Black Vulture*, Golden Eagle, Peregrine Falcon, Clapper Rail, White-rumped Sandpiper, Lesser Black-backed Gull, Northern Saw-whet Owl, Common Raven, Olive-sided Flycatcher, *Blue Grosbeak* and Seaside Sparrow.

REGION 10 — MARINE

SEYMOUR SCHIFF AND ALVIN WOLLIN

The average monthly temperatures for the spring period were close to normal for all three months. However, the overall feeling was that the season was late and cold despite the statistics. Actually, it was mostly bland because of the lack of rain. March did have wide temperatures swings with the low reaching 20°F on the night of 10 Mar, but rising to a high of 70°F three days later. April and May on the other hand closely followed their norms. Precipitation was a different matter. March's rainfall was 1.26 inches against a norm of 4.08; April's 2.29 against 4.20 and May's 2.84 against 4.42. With no April showers, the season had 6.31 inches of rain less than normal. The rain, when it came, was mostly in mid week. On the weekends when most birders were out, the weather was not conducive for grounding migrants.

John P. Askildsen summarized an extraordinary pelagic trip he led to Block Canyon on 4 Mar. These notes are printed with his permission. His words tell it all. "Fifty birders in all participated in this trip. The weather was cooperative. We experienced temperatures ranging from the upper 30s to the low 40s. The water temperature ranged from 37 to 43°F as well. Seas were 3 to 5 feet. Winds were out of the ese at 15 mph. Skies were generally overcast with some broken sunshine. The bird list follows: Northern Fulmar - 58 (all light morph); Northern Gannet - 75; *Great Skua* - 1 (adult 63 miles out at north end of Block Canyon); Black-legged Kittiwake - 110; Dovekie - 300 (largest flock 45-50 individuals); *Common Murre* - 13 (a new one day record); Thick-billed Murre - 2; unidentified murre - 4; Razorbill - 71; *Atlantic Puffin* - 58 (54 imm, 4 ad, a new west Atlantic one day record high count outside the breeding grounds); large alcid unidentified to species - 5. The *Great Skua* was found amongst hundreds of *Great Black backed Gull*, lesser numbers of *Herring Gull* and approximately 15 *Northern Fulmar* that were loitering around a commercial trawler. After 'stealing' the birds from the trawler, we watched the beast for about one half hour and then finally left it."

On 19 Mar Steve Walter came up to the eager birders hoping to see a *Ross's Gull*, which appeared for the consecutive second year (details under species accounts), and informed the watchful group that an *Eared Grebe* was in the surf west of the Pt. Lookout beaches. A horde of birders immediately departed for the site. They came, they saw, and ran back. When the stragglers arrived (your editors among them), they also

found the bird in a large group of Horned Grebe. Being more patient, this later group had the added pleasure of finding a Red-necked Grebe that the first group overlooked in their haste. We know of no instance when all three grebes have occurred in the Northeast together in the same flock. The three species offered an unprecedented opportunity to study and compare field marks. In addition large numbers of Piping Plover were all but overlooked by the throngs looking for the Ross's Gull.

On the evening of 21 Apr the fog rolled in with SW winds. Pat Lindsay, birding with Andy Baldelli, reported from Robert Moses SP on the following morning that from 7:00 AM until about noon, the air was literally filled with warblers, sparrows and other songbirds zipping by overhead. The large majority did not land but, apparently because of the fog, flew low along the median at or below tree level, at times barely missing their heads. At about 10:30 the fog began to lift and a few of the birds began to land. Among the birds then seen were Yellow-throated Warbler, Prothonotary Warbler, Rose-breasted Grosbeak, Blue Grosbeak, several Indigo Bunting, and two Orchard Oriole. This phenomenon was restricted to the one location. At both Captree SP just across Fire Island Inlet and at Jones Beach SP 20 miles to the west, it was just foggy and no birds were moving. The same situation existed at Pt Lookout further west across the Jones Beach Inlet. But there in the fog, Bob Kurtz reported 47 Purple Sandpiper on one jetty that held a scant half-dozen just a few days before. His unexpected land birds finds were a Cerulean Warbler on one jetty, a Worm-eating Warbler on another, but almost no other birds.

Reports and our own observations indicate that Cape May Warbler and Tennessee Warbler continue to be scarce.

The DEC has begun to introduce Wild Turkey into this Region again. This latest experiment started two years ago with the release of 30 birds to Hither Hills SP, 20 to South Haven County Park and an additional 20 the following year. The birds are alive and well at Wertheim National Wildlife Refuge. Others are at Connetquot SP. The last experiment, in NASS, required massive feeding. The birds became tame, a nuisance to the surrounding communities, and they were subsequently removed.

Rarities for the season include Eared Grebe, Northern Fulmar, *Mississippi Kite*, *Sandhill Crane*, *Northern Lapwing*, Curlew Sandpiper, *Long-tailed Jaeger*, *Great Skua*, *Ross's Gull*, Dovekie, *Common Murre*, Thick-billed Murre, *Atlantic Puffin*, *White-winged Dove*, *Pileated Woodpecker* and Varied Thrush.

WINTER REPORT

REGION 6 - ST. LAWRENCE

KENNETH L. CROWELL

The winter 1994-95 averaged warmer and slightly drier than normal. December had maximum temperatures in the high 50s 23-24 Dec and minima below zero 12-13 Dec. Major snowfalls occurred in various locations on 8, 11 and 17 Dec. Total snowfall was 2-3 feet in the Tug Hill but less than a foot in the lowlands. January also was several degrees warmer as well as wetter than usual. From minimum temperatures about -20°F on 11 Jan, the mercury climbed to the high 60s 15-16 Jan. During this unusual January thaw, ice in streams broke up and Spring Peeper was reported calling. Winter closed in again and February temperatures were below normal. The lowlands from Watertown to Massena received two to three times their normal snowfall. The month ended with sleet and above freezing temperatures.

With open water prevailing, waterfowl lingered late but some species were dispersed, resulting in low counts. Visiting raptors were generally scarce. There was a *Gyr Falcon* but only one Snowy Owl. It was a good season for wintering accipiters and Short-eared Owl. Numbers and diversity of visiting gull species were low. Blue Jay numbers were high and Black-capped Chickadee numbers moderate. Good numbers of American Robin overwintered, and high numbers of Mourning Dove, Blue Jay, Brown-headed Cowbird and American Goldfinch were reported at feeders. There was only one report of Bohemian Waxwing, and it was another low year for most winter finches, with only one sighting of Common Redpoll and one unconfirmed report of Pine Grosbeak. Evening Grosbeak numbers generally were down, but Pine Siskin was well reported both on CBCs and in s StLA. Both crossbills and both Black-backed and Three-toed Woodpeckers were reported.

The biggest headline maker was an adult *Ross's Gull*. Scarcely less noteworthy were two *Northern Fulmar* and two *Northern Gannet*, and let's not overlook a *Great Gray Owl*. Half-hardy species included *Double-crested Cormorant*, Red-shouldered Hawk, Northern Flicker, Golden-crowned Kinglet, Eastern Bluebird, Hermit Thrush, *Savannah Sparrow* and Northern Oriole.

Bald Eagle: few sightings, especially s StLA where birds dispersed due to low snow cover; max two ad, six imm Wellesley I; three singles SLR. **N. Harrier:** max four CV 7 Dec; female harassing Short-eared Owl and stealing a mouse left by the owl on a hay bale CV 12 Feb (M&BW). **Sharp-shinned Hawk:** 15 reports of 9+ individuals. **Cooper's Hawk:** nine reports. **N. Goshawk:** six reports. **Rough-legged Hawk:** numbers down; max eight Canton 31 Dec. **Gyr Falcon:** dark imm Three Mile Pt Road T Brownsville JEFF 26 Feb. **Gray Partridge:** max four CV 15 Feb, scarcer than usual. **Ring-necked Pheasant:** max six Perch R WMA 18 Jan; a few other singles. **Am. Coot:** max six HH 23 Dec. **Bonaparte's Gull:** max four CV 13 Jan. **Ring-billed Gull:** max 480 MSD 5 Dec. **Herring Gull:** max 3512 MSD 22 Dec. **Iceland Gull:** max 14 MSD 15 Dec.

Glaucous Gull: max 24 MSD 9 Jan. **Great Black-backed Gull:** max 2450 MSD 9 Jan. **Ross's Gull:** winter ad PtPen 4 Jan (TD, NYSARC), a similar bird in Montreal 12 Dec could have been the same bird.

Mourning Dove: max 39 Watertown feeder 11 Feb. **Short-eared Owl:** max 33 Cape Vincent-Brownville area (M&BW). **Great Gray Owl:** one Hammond 4 Jan (PK), details not yet available. **Snowy Owl:** one Hammond 22 Jan. **E. Screech-Owl:** three RMSP 22 Feb. **Belted Kingfisher:** one HH 10 Dec. **Red-bellied Woodpecker:** one Henderson during season; one PtPen 4 Jan, new location. **Three-toed Woodpecker:** one NBCBC. **Black-backed Woodpecker:** one NBCBC; one Peavine Swamp T Clifton 22 Jan. **N. Flicker:** ten reports, more than usual.

Horned Lark: max 300 Woodville 8 Jan. **Blue Jay:** max 33 Lorraine 4 Feb. **Com. Raven:** two RMSP 31 Jan, unusual location. **Golden-crowned Kinglet:** max of 91 NBCBC. **E. Bluebird:** four reports, max four Hammond 1 Feb. **Am. Robin:** max 142 RMSP 15 Jan, many small flock all winter. **Bohemian Waxwing:** 14 Louisville 17 Jan, only report. **N. Shrike:** Five NBCBC plus a total of seven other individuals, scarce. **European Starling:** overwintered even in Tug Hill.

Am. Tree Sparrow: max 500 PtPen 13 Dec. **Savannah Sparrow:** one PtPen 13 Dec (BH), very late. **Song Sparrow:** five singles. **White-throated Sparrow:** three singles. **Dark-eyed Junco:** many overwintered, even on Tug Hill; *Oregon*-type NBCBC. **Lapland Longspur:** max 21 CV 11 Jan, three other reports, more than usual. **Snow Bunting:** max 200-400 in L Ontario lowlands. **Brown-headed Cowbird:** max 80 T Adams feeder 7 Feb. **N. Oriole:** one at several Henderson feeders during to mid Jan. **Purple Finch:** six reports, max 20 CV 3 Dec. **House Finch:** max 70 HH before storm 6 Jan. **Red Crossbill:** eight Clifton 22 Jan, only report. **White-winged Crossbill:** 32 NBCBC; one RMSP 29 Dec. **Am. Goldfinch:** max 33 Adams 3 Feb.

INSTRUCTIONS FOR AUTHORS

The Kingbird publishes papers on all aspects of the ornithology of New York State. Manuscripts must be typed single-sided, double-spaced with at least one-inch margins on all sides. Follow similar articles in recent issues as guides to style. Names of bird species follow the most recent A.O.U. Check-list and its supplements. Place tables on a separate page each. Figures should be drawn in black ink. Photographs should be submitted as 35 mm slides or as black-and-white glossy prints. Place all captions on a separate page. Submission of manuscripts on computer diskette (3.5 inch preferred) is encouraged, but identification of the word processing software (including its version) used and printed copy must accompany such submissions. Manuscripts may be submitted to The Editor of *The Kingbird* or to the Chair of the Publications Committee.
